## 1.3 Structure Overview (Synopsis)

This document specifies the file format for RDL, a file type that is used to represent the metadata for defining a **report**. A **report definition** file is an XML file, as specified in [\[XML\]](#).

### 1.3.1 Report Definition Language File Content

SQL Server Report Definition Language (RDL) consists primarily of the following kinds of information:

- **Report data**: Instructions about how to obtain the data to display in the report (such as a connection string and **query**), along with information about the structure of that data (such as field names).
- **Calculations**: Calculations and transformations to be performed on the report data, including grouping, sorting, filtering, aggregations, and scalar formulas.
- **Report layout**: Instructions about how to structure, format, and present the data and calculations in the resulting report. This also includes information about the kinds of end-user interactivity to make available in the report.

### 1.3.2 Report Rendering

RDL is output format-neutral. This means that reports that are defined by using RDL can be output or rendered to a variety of formats including Web-ready and print-ready formats or data-focused formats such as XML.

RDL itself is not narrowly prescriptive with respect to the output that results from rendering a report. When generating different output formats, products may represent RDL constructs slightly differently or ignore certain constructs completely. For example, a product that generates a textual format may choose to ignore **images** in the report.

### 1.3.3 Document Structure

The root element of an RDL document is the [Report](#) element.

Subelements are order-independent. This includes items in collection elements, unless the collection is explicitly defined as an ordered **list**.

Unless otherwise specified, a subelement may occur once at most as a child of its parent element. A collection may have multiple instances of a subelement. This will be explicitly stated.

White space is not trimmed from values in the RDL document.

### 1.3.3.1 XML Namespace

The namespace URI for RDL is as follows:

**<http://schemas.microsoft.com/sqlserver/reporting/yyyy/mm/reportdefinition>**

The date component (yyyy/mm) indicates the date of the release of that version of RDL. The date component is used throughout this document to identify one of the following specific versions of RDL:

- 2003/10 [\[MS-RDL200310\]](#)
- 2005/01 [\[MS-RDL200501\]](#)
- 2008/01 [\[MS-RDL200801\]](#)
- 2009/01 (section [5.4](#))

The standard file name extension for RDL files is .rdl.

The **MIME type** to use for RDL files is text/xml.

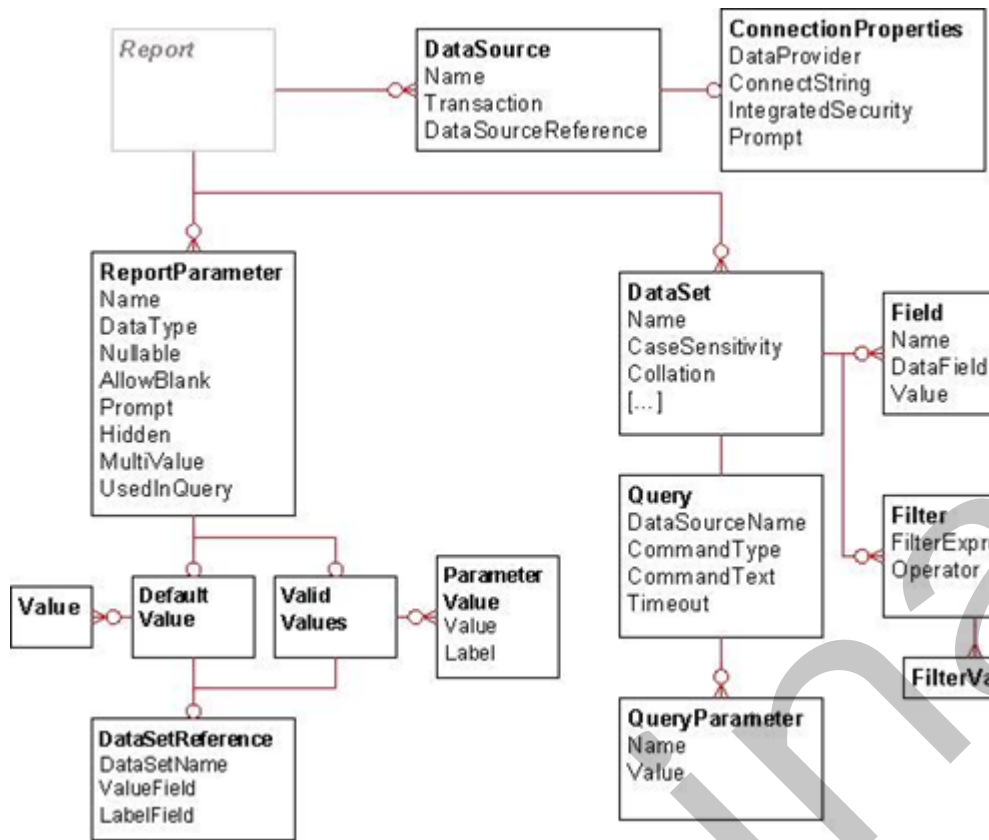

### 1.3.4 Report Definition Overview Diagrams

This section contains diagrams that illustrate the schema of the 2009/01 (section [5.4](#)) version of Report Definition Language.

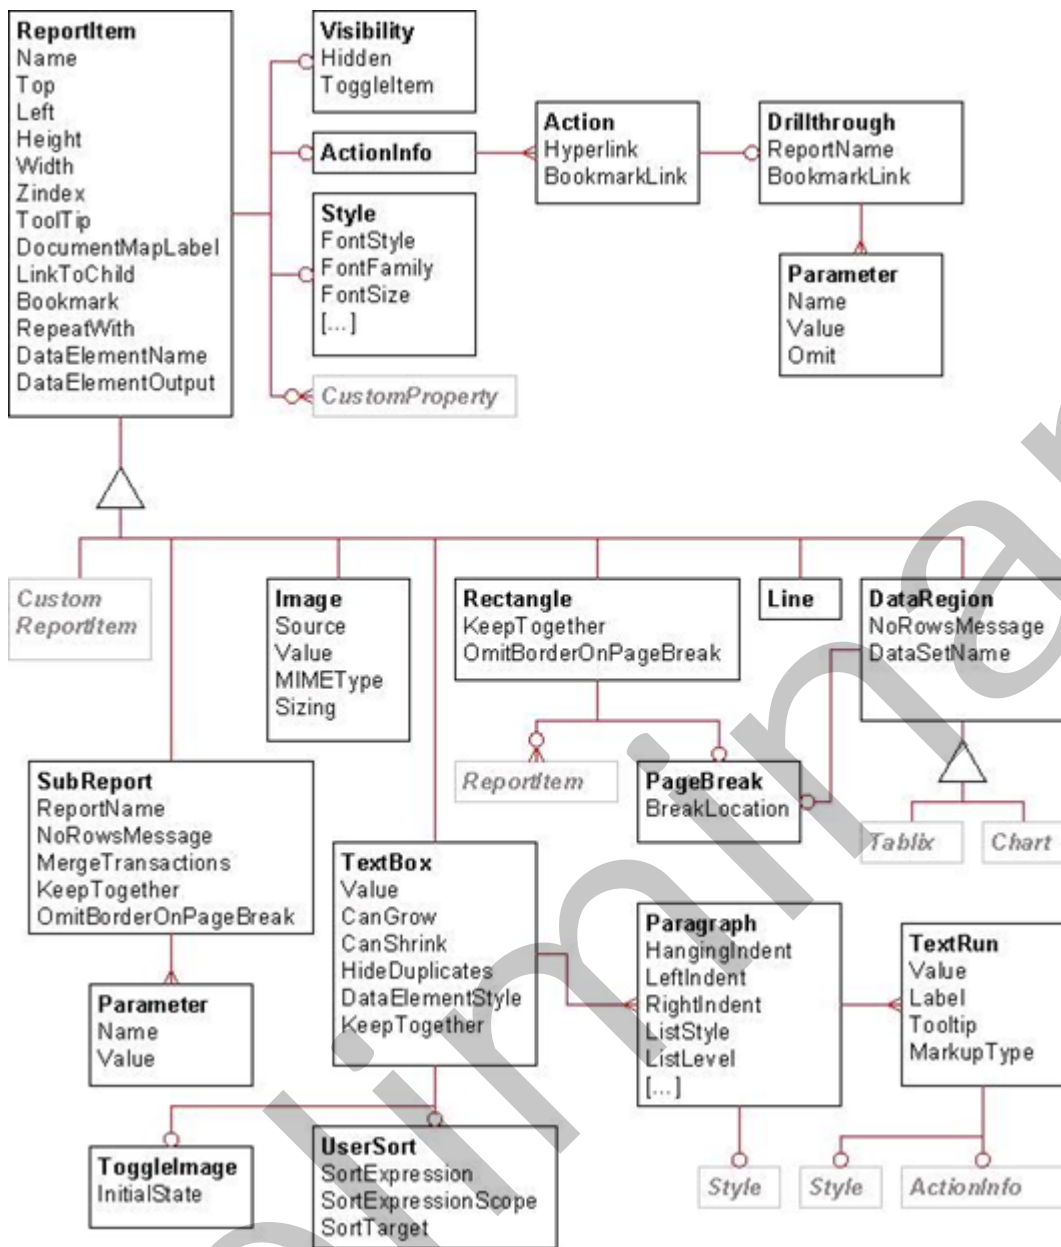

Note that for simplicity, certain related types are represented in the diagrams as abstract base types. For example, the abstract base type **ReportItem** does not appear in RDL. Only concrete derived types (such as **Textbox**) appear in RDL. The following are the abstract base types that are shown in the diagrams: **ReportItem**, **DataRegion**, **Gauge**, **GaugeScale**, and **GaugePointer**.

**Figure 2: Report data**

**Figure 3: Report items**

**Figure 7: Gauge panel**

#### 1.4 Relationship to Protocols and Other Structures

RDL is used as a payload in the following protocols:

- ReportExecution2005 [[MS-RSWSRE2005](#)]: Used when setting the definition of a report for execution.
- ReportService2005 [[MS-RSWSRMNM2005](#)]: Used when setting or retrieving the definition of a report in the report catalog.
- ReportService2006 [[MS-RSWSRMSM2006](#)]: Used when setting or retrieving the definition of a report in the report catalog.

#### 1.5 Applicability Statement

This persistence format is applicable for use as a standalone representation of report metadata and for publishing report metadata from a client to a server.

#### 1.6 Versioning and Localization

This document specifies the structures for the following versions of RDL:

- 2003/10 [[MS-RDL200310](#)]
- 2005/01 [[MS-RDL200501](#)]

- 2008/01 [[MS-RDL200801](#)]
- 2009/01 (section [5.4](#))

These versions are defined in [Appendix B](#) in this document.

There are no localization-dependent structures in the RDL file format.

## 1.7 Vendor-Extensible Fields

RDL is an open schema. Application authors may extend and annotate RDL with their own attributes and subelements (in their own namespace). Note, however, that tools that use RDL do not have to preserve unrecognized elements when loading and persisting. For properties that must be preserved independent of the tool, the [CustomProperties](#) element should be used instead.

Preliminary

## 2 Structures

### 2.1 Introduction

As an XML file that conforms to an XML schema, RDL is comprised of simple and complex elements. RDL has other structural constraints and restrictions, as well, which cannot be expressed fully by an XML schema.

This section describes the elements defined in the RDL, describing the meaning, restrictions, and constraints of each element and its value, if applicable; the relationships between the element and others; and the XML schema definition of the element.

The RDL XML file is a valid XML file, as specified in [\[XML\]](#), which conforms to one of the XSD specifications defined in section [1.3.3.1](#) of this document, depending on the RDL version. Section [5](#) of this document describes the structures of an RDL XML file that conforms to this specification.

### 2.2 Common RDL Types

#### 2.2.1 String

If the RDL format specifies an element or attribute as type **String**, it MUST be a valid UNICODE string, as specified in [\[XMLSCHEMA2-3.2.1\]](#) for **xsd:string**.

#### 2.2.2 Integer

If the RDL format specifies an element or attribute as type **Integer**, it MUST be a valid **int** value, as specified in [\[XMLSCHEMA2-3.3.17\]](#) for **xsd:int**. A valid **int** value MUST be greater than -2147483649 and MUST be less than 2147483648.

#### 2.2.3 Boolean

If the RDL format specifies an element or attribute as type **Boolean**, it MUST be a valid **Boolean** value, as specified in [\[XMLSCHEMA2-3.2.2\]](#) for **xsd:Boolean**.

#### 2.2.4 Float

If the RDL format specifies an element or attribute as type **Float**, it MUST be a valid IEEE single-precision 32-bit floating point type [\[IEEE754\]](#), as specified in [\[XMLSCHEMA2-3.2.4\]](#) for **xsd:float**.

#### 2.2.5 DateTime

If the RDL format specifies an element or attribute as type **DateTime**, it MUST be a valid date and time-of-day value as specified in [\[ISO-8601\]](#) and in [\[XMLSCHEMA2-3.2.7\]](#) for **xsd:datetime**.

#### 2.2.6 NormalizedString Elements and Attributes

The RDL format specifies a number of elements and attributes in the XSD structure as **xsd:NormalizedString**. This MAY enforce further restrictions on the identifier string values for these elements and attributes.

Unless explicitly specified otherwise, when the value of an element or attribute is **xsd:NormalizedString**, the file format validation implementation of RDL Schema versions [\[2003/10\]](#) and later specify that every **xsd:NormalizedString** identifier MUST be:

- Unique within the entire report.
- A **CLS-compliant identifier** [\[UTR15\]](#) name.

In addition, RDL Schema versions [\[2008/01\]](#) and later further restrict the maximum length of identifiers to 256 characters.

Elements whose value must be xsd:**NormalizedString** can be referenced by the following elements and attributes.

### 2.21.1 UserSort.SortExpression

**Applies to RDL schemas 2005/01** [\[MS-RDL200501\]](#) and later

The **UserSort.SortExpression** element specifies an expression on which to sort. This element **MUST** be specified. Its value **MUST** be a [String](#) [\[XMLSCHEMA2-3.2.1\]](#) or an expression that evaluates to a **Variant**.

The same restrictions that applied to [Filter.FilterExpression](#) instances within a [Group](#) **MUST** also apply to this element. If the expression that this element specifies contains an **aggregate function**, the aggregate function **MUST** have a **scope** that is equal to or that contains the value of [UserSort.SortExpressionScope](#). If the peer **UserSort.SortExpressionScope** element is not defined, the **UserSort.SortExpression** element **MUST NOT** contain aggregate function instances without an explicit scope.

### 2.21.2 UserSort.SortExpressionScope

**Applies to RDL schemas 2005/01 [MS-RDL200501] and later**

The **UserSort.SortExpressionScope** element specifies the name of the scope (data region or [Group](#)) in which to evaluate the [UserSort.SortExpression](#). The **UserSort.SortExpressionScope** element is optional.

If the **UserSort.SortExpressionScope** element is specified, its value MUST be a [String \[XMLSCHEMA2-3.2.1\]](#). If this element is not present, the sort expression will be evaluated and the sort will be performed independently in each **detail scope** within the sort target.

The value of the **UserSort.SortExpressionScope** element MUST be equal to or contained within the current scope. If the containing [Textbox](#) has no current scope (for example, the text box is not contained within any data region or **Group**), the value of this element MUST be equal to or contained within the scope that is defined by the peer [UserSort.SortTarget](#) element.

The value of the **UserSort.SortExpressionScope** element MUST NOT evaluate to a detail scope (for example, a **Group** that has no [Group.GroupExpressions](#) instance). The [DataSet](#) that is associated with **UserSort.SortExpressionScope** MUST be the same as the **DataSet** that is associated with the peer **UserSort.SortTarget** element. Sorting for the [UserSort](#) MUST take place within the **Group** that contains the **UserSort.SortExpressionScope**.

Following is the parent element of the **UserSort.SortExpressionScope** element.

### 2.21.3 UserSort.SortTarget

**Applies to RDL schemas 2005/01 [MS-RDL200501] and later**

The **UserSort.SortTarget** element specifies the name of a data region ([Tablix](#), [Chart](#), [GaugePanel](#), [CustomReportItem](#), [List](#), [Table](#), [Matrix](#)), [Group](#), or [DataSet](#) to which to apply the sort. This element is optional.

If the **UserSort.SortTarget** element is specified, its value MUST be a [String \[XMLSCHEMA2-3.2.1\]](#) that MUST be the name of the current scope, the name of an ancestor scope, or the name of a peer scope that is a data region. If this element is not present, its value MUST be interpreted as that of the peer scope.

## 2.22 Tablix

**Applies to RDL schemas 2008/01 [MS-RDL200801] and later**

The **Tablix** element defines a tablix, which is a layout grid that consists of columns and rows that can optionally be filtered, sorted, grouped, nested, and repeated.

The tablix incorporates the collective functionality of the [List](#), [Table](#), and [Matrix](#) that were defined in versions of RDL prior to RDL schema 2008/01 [MS-RDL200801].

An element of type **Tablix** MUST NOT be specified within a page header or a page footer.

There are two collections of [TablixMember](#) elements. **TablixMember** elements that have a [TablixRowHierarchy](#) ancestor in the tablix are called tablix **row members**. **TablixMember** elements that have a [TablixColumnHierarchy](#) ancestor in the tablix are called tablix column members.

The quantity of [TablixColumn](#) elements within the tablix MUST equal the quantity of tablix column members that do not have a **TablixMember** element descendant. The quantity of **TablixColumn** elements within the tablix MUST equal the quantity of [TablixCell](#) elements within the tablix.

The value of the [Tablix.LayoutDirection](#) element changes the effect that the value of the [Tablix.GroupsBeforeRowHeaders](#) element will have. This is described under **Tablix.GroupsBeforeRowHeaders**.

Columns of tablix **row headers** MUST be laid out before columns that are defined by **TablixColumn** elements, and they MUST be considered in conjunction with the **Tablix.GroupsBeforeRowHeaders** element.

The [Tablix.TablixCorner](#) element MUST be specified if the following conditions are true:

- The tablix has a **TablixRowHierarchy** element child that has a [TablixHeader](#) element descendant.
- The tablix has a **TablixColumnHierarchy** element child that has a **TablixHeader** element descendant.

If either the **TablixRowHierarchy** element or the **TablixColumnHierarchy** element does not have a **TablixHeader** element descendant, the **Tablix** element MUST NOT have a child [TablixCorner](#) element.

If a [TablixCornerRow](#) element is specified, the quantity of descendant [TablixCornerCell](#) elements in the tablix MUST equal the quantity of unique cumulative widths for each tablix row member of the tablix. "Cumulative width" for a tablix row member is defined as the sum of the values of all [TablixHeader.Size](#) elements that are descendant of the tablix row member.

If a **TablixCorner** element is specified, the quantity of descendant **TablixCornerRow** elements in the tablix MUST equal the quantity of unique cumulative heights for each tablix column member of

the tablix. "Cumulative height" for a tablix column member is defined as the sum of the values of all **TablixHeader.Size** elements descendant of the tablix column member.

Borders and any **background images** that are specified under [Tablix.Style](#) can be repeated on vertical and horizontal page breaks by using the [Tablix.OmitBorderOnPageBreak](#) element.

The informative reference *Understanding Tablix Data Region Areas* [[MSDN-UTDRA](#)] is useful to understand the nomenclature of tablix components.

### 2.42 Matrix

**Applies to RDL schemas 2003/10** [\[MS-RDL200310\]](#) **and 2005/01** [\[MS-RDL200501\]](#) **only**

The **Matrix** element specifies a grid of regions that repeats with each column group and row group in the rowset. The grid consists of columns and rows that can optionally be filtered, sorted, grouped, nested, and repeated. Matrices provide functionality similar to crosstabs and pivot tables. Unlike a [Table](#), which has a static set of columns, matrix columns can be dynamic.

A matrix has a number of components; these are the corner, **dynamic row** and static row group headers, **dynamic column** and static column group headers, and detail cells. The corner is a single cell in the upper-left corner. You can use the corner cell to display a label for the matrix, or you can leave it empty. When the report is rendered, dynamic column headers expand right or left for as many columns as there are groups. Dynamic row headers expand down the page. The data that appears in the detail cells are aggregates based on the intersections of columns and rows.

The following are the parent elements, attributes, and child elements of the **Matrix** element.

### 2.320.1 Filters.Filter

The **Filters.Filter** element specifies a [Filter](#) that is used to restrict the rows within a [DataSet](#) (in RDL schemas 2008/01 [\[MS-RDL200801\]](#) and later), a group, or a data region. **Filters.Filter** elements SHOULD be applied in the order in which they are specified within the parent [Filters](#) collection. The **Filters.Filter** element is of type **Filter**.

```

### 2.321 Filter

The **Filter** element specifies a filter to apply to rows of data within a [DataSet](#) (for RDL schemas 2008/01 [\[MS-RDL200801\]](#) and later), a group, or a data region.

  </xsd:choice>
  <xsd:anyAttribute namespace="##other" processContents="skip" />
</xsd:complexType>
```

### 2.321.1 Filter.FilterExpression

The **Filter.FilterExpression** element specifies an expression that is evaluated for each instance of a group, or for each row of data that is associated with a [DataSet](#) (for RDL schemas 2008/01 [\[MS-RDL200801\]](#) and later), a group, or a data region. This expression is then compared to the value of the [Filter.FilterValues](#) element by using the [Filter.Operator](#) element. Failed comparisons MUST result in the row or instance being filtered out of its containing group, dataset, or data region.

The **Filter.FilterExpression** element MUST be specified, and it MUST NOT contain references to report items. If the **Filter.FilterExpression** element is not within a group, its value MUST NOT contain an aggregate function. If this element is within a group, it MUST NOT contain any instances of the **RunningValue** aggregate functions, and it MUST NOT contain any **First** or **Last** aggregate functions with anything but the default (current) scope.

Following is the parent element of the **Filter.FilterExpression** element.

Parent elements
<a href="#">Filter</a>

The following is the XML Schema definition of the **Filter.FilterExpression** element.

```
<xsd:element name="FilterExpression" type="xsd:string" />
```

### 2.321.2 Filter.FilterValues

The **Filter.FilterValues** element specifies the values to compare to a [Filter.FilterExpression](#). The **Filter.FilterValues** element MUST be specified and is of type [FilterValues](#).

Following is the parent element of the **Filter.FilterValues** element.

Parent elements
<a href="#">Filter</a>

The following is the XML Schema definition of the **Filter.FilterValues** element.

```
<xsd:element name="FilterValues" type="FilterValuesType" />
```

### 2.321.3 Filter.Operator

The **Filter.Operator** element specifies an operator to use to compare the values of [Filter.FilterExpression](#) and [FilterValues](#). The **Filter.Operator** element MUST be specified. The value of this element MUST be a [String \[XMLSCHEMA2-3.2.1\]](#), and it MUST be one of the following:

**Equal**: Specifies an equality comparison.

**Like**: Specifies a like comparison (that is, it compares a string against a pattern).

**NotEqual**: Specifies an inequality comparison.

**GreaterThan**: Specifies a comparison to determine whether the **Filter.FilterExpression** value is greater than the **FilterValues** values.

**GreaterThanOrEqual:** Specifies a comparison to determine whether the **Filter.FilterExpression** value is greater than or equal to the **FilterValues** values.

**LessThan:** Specifies a comparison to determine whether the **Filter.FilterExpression** value is less than the **FilterValues** values.

**LessThanOrEqual:** Specifies a comparison to determine whether the **Filter.FilterExpression** value is less than or equal to the **FilterValues** values.

**TopN:** Specifies whether the **Filter.FilterExpression** value is within the top *N* data values, where *N* is specified by [FilterValues.FilterValue](#).

**BottomN:** Specifies whether the **Filter.FilterExpression** value is within the bottom *N* data values, where *N* is specified by **FilterValues.FilterValue**.

**TopPercent:** Specifies whether the **Filter.FilterExpression** value is within the top *N* percent of data values, where *N* is specified by **FilterValues.FilterValue**.

**BottomPercent:** Specifies whether the **Filter.FilterExpression** value is within the bottom *N* percent of data values, where *N* is specified by **FilterValues.FilterValue**.

**In:** Specifies whether the value of **Filter.FilterExpression** is equal to any **FilterValues.FilterValue** instances.

**Between:** Specifies whether the value of **Filter.FilterExpression** is between the values of two **FilterValues.FilterValue** instances.

The **TopN**, **BottomN**, **TopPercent**, and **BottomPercent** operators SHOULD include ties in the resulting data. String comparisons within filters SHOULD be locale-dependent. The NULL constant is equal to itself.

The **TopPercent** and **BottomPercent** operators SHOULD round up and down, respectively, if the percentage that is specified would result in a partial item being included (for example, if the Top 25% of 13 items is four items and the Bottom 75% is nine items). If the value of the **Filter.Operator** element is "In", multi-value report parameters that have the [ReportParameter.MultiValue](#) element specified with a value of true MUST be supported and treated as multiple **FilterValue** instances.

In the following example, if "Cities" is a multi-value parameter for a [Filter](#) that references "Cities" within any **FilterValues.FilterValue** elements, the following RDL:

```
<FilterValues>
  <FilterValue>=Parameters!Cities.Value</FilterValue>
</FilterValues>
```

MUST be equivalent to the following RDL:

```
<FilterValues>
  <FilterValue>=Parameters!Cities.Value[0]</FilterValue>
  <FilterValue>=Parameters!Cities.Value[1]</FilterValue>
  [...]
</FilterValues>
```

Following is the parent element of the **Filter.Operator** element.

      <xsd:enumeration value="GreaterThanOrEqual" />
      <xsd:enumeration value="LessThan" />
      <xsd:enumeration value="LessThanOrEqual" />
      <xsd:enumeration value="TopN" />

      <xsd:enumeration value="TopPercent" />
      <xsd:enumeration value="BottomPercent" />
      <xsd:enumeration value="In" />
      <xsd:enumeration value="Between" />
    </xsd:restriction>
  </xsd:simpleType>
</xsd:element>

### 2.325.3 QueryParameter.Value.DataType

**Applies to RDL schemas 2008/01** [\[MS-RDL200801\]](#) and later

The **QueryParameter.Value.DataType** attribute specifies the data type of a value if the value is a constant. The **QueryParameter.Value.DataType** attribute is optional. If this attribute is present, its value MUST be the name of one of the following RDL data types: [String \[XMLSCHEMA2-3.2.1\]](#), [Boolean \[XMLSCHEMA2-3.2.2\]](#), [DateTime \[XMLSCHEMA2-3.2.7\]](#), [Integer \[XMLSCHEMA2-3.3.17\]](#), or [Float \[XMLSCHEMA2-3.2.4\]](#). If this attribute is not present, the constant value MUST be interpreted as a **String**.

Following is the parent element of the **QueryParameter.Value.DataType** attribute.

Parent elements
<a href="#">QueryParameter.Value</a>

## 2.326 Expressions

### 2.326.1 Expression Syntax

In addition to supporting constants as element values, RDL also supports an expression language. All expressions in RDL MUST begin with the character "=", and in the Microsoft implementation MUST be specified in a Visual Basic-compatible syntax [MS-VBNET].

Expression values that do not begin with "=" are treated as constants of the type expected by the property if that type is [Boolean \[XMLSCHEMA2-3.2.2\]](#), [String \[XMLSCHEMA2-3.2.1\]](#), or [Integer \[XMLSCHEMA2-3.3.17\]](#) [XMLSCHEMA2/2].

For example, the [Visibility.Hidden](#) property expects a **Boolean**. Therefore, the strings true and false are treated as **Boolean** constants. For properties that take a **Variant**, all values that do not start with "=" are treated as string constants.

### 2.326.2 Custom Code References

A report MAY include references to custom code methods and custom assemblies. Custom assemblies that are referenced in a report MUST be specified at the report level via the [CodeModules](#) element. Static methods in custom assemblies MAY be accessed globally from expressions within the report, and, if referenced from expressions, MUST use the syntax:

```
ClassName.MethodName (...)
```

as in the following example:

```
MyCurrencyConverterClass.Convert (...)
```

A report MAY contain instance-based methods. Such methods MUST be instantiated though the [Classes](#) element. The methods MAY be accessed via a globally available **Code** member, and MUST use the syntax:

Code.InstanceName.MethodName (...)

as in the following example:

Code.CurrencyConverter.Convert (...)

### 2.326.3 Built-in Code Namespace References

In addition to explicit user-defined references as specified through custom code references, expressions MAY reference function libraries if they are made available by the implementation.

#### 2.326.3.1 Microsoft Implementation

The following namespaces and classes are available:

- **Microsoft.VisualBasic**
- **System.Convert**
- **System.Math**
- **System**

These standard namespaces specify frequently needed functionality as specified in [MS-VBNET].

#### 2.326.4 Data Types

Every expression that is used in an expression element or as an argument to an RDL function MUST return one of the following RDL data types: [String \[XMLSCHEMA2-3.2.1\]](#), [Boolean \[XMLSCHEMA2-3.2.2\]](#), [Float \[XMLSCHEMA2-3.2.4\]](#), [DateTime \[XMLSCHEMA2-3.2.7\]](#), Binary, or an array of these types (a **VariantArray**).

In the Microsoft implementation, the following table specifies how expression return types are converted to RDL data types:

RDL Type	CLR Types
<b>String</b>	<b>String, Char, GUID</b>
<b>Boolean</b>	<b>Boolean</b>
<b>Integer</b> <a href="#">&lt;38&gt;</a>	<b>Int16, Int32, Int64, UInt16, UInt32, UInt64, Byte, SByte, TimeSpan</b>
<b>DateTime</b>	<b>DateTime, DateTimeOffset</b>
<b>Float</b>	<b>Single, Double, Decimal</b>
<b>Binary</b>	<b>Byte[]</b>
<b>Variant</b>	MUST be specified as one of the following RDL types: <b>String, Boolean, Integer, DateTime, Float, or Binary</b> .
<b>VariantArray</b>	Array of <b>Variant</b> <a href="#">&lt;39&gt;</a>

RDL Type	CLR Types
<b>StringArray</b>	Array of <b>String</b>
<b>Numeric</b>	MUST be specified as one of the following RDL types: <b>Integer</b> or <b>Float</b> .
<b>Scalar</b>	MUST be specified as one of the following RDL types: <b>Integer</b> , <b>Float</b> , or <b>DateTime</b> .

### 2.326.5 Expression Error Handling

Errors that occur during expression evaluation fall into one of two categories:

- Critical errors
- Critical errors result in the report (or the currently requested page) failing to render, returning an error message instead.
- Errors in the evaluation of the following properties are considered to be critical errors: [Filter.FilterExpression](#), [Filter.FilterValues](#), [Group.GroupExpressions](#), [Variable.Value](#), [Visibility.Hidden](#), and [SortExpression.Value](#).
- Non-critical errors
- In the Microsoft implementation, a non-critical error does not cause the report to fail to render but instead registers a warning and falls back to the default value for the particular RDL property. The exception to this rule is [TextRun.Value](#). An error in **TextRun.Value** results in the particular [TextRun](#) instance containing the string "#Error".

### 2.326.6 Global Collections

The following global object collections are accessible from expressions, with restrictions as specified in the following subsections for each collection.

Collection	Specification	Item type
<a href="#">Fields</a>	Fields in the current dataset	<a href="#">Field</a>
<a href="#">Parameters</a>	Report parameters	<a href="#">Parameter</a>
<a href="#">ReportItems</a>	All text boxes in the report	<b>ReportItem</b>
<a href="#">Globals</a>	Global variables	<b>VARIANT</b>
<a href="#">User</a>	User-specific data	<b>VARIANT</b>

Data sources in global collections, if referenced from expressions, MUST use standard Visual Basic collection syntax [MS-VBNET], specified as one of the following:

*Collection!ObjectName*

*Collection.Item("ObjectName")*

*Collection("ObjectName")*

such as in the following example:

User!Language

Optionally, items in the **Globals** and **User** collections MAY also be accessed by using property syntax:

Collection.ObjectName

such as in:

Globals.PageNumber

Circular references involving items in global collections are errors.

### 2.326.6.1 Fields

The **Fields** collection contains a set of [Field](#) objects. A **Field** object MAY specify one or more properties. If one of these properties is referenced in an expression, it MUST be among the set of predefined properties that can be accessed by using either the property syntax:

Fields!FieldName.PropertyName

or the collection syntax:

Fields!FieldName!PropertyName

Fields!FieldName("PropertyName")

Fields!FieldName.Properties("PropertyName")

such as:

Fields!Region.BackgroundColor

### 2.326.6.2 Predefined Field Properties

When a report is executed, dataset queries may return a different set of fields than were originally defined in the report. The **IsMissing** property specifies whether the field was found in the resulting dataset. The **Value** property of missing fields is NULL.

In addition, data providers that support field properties can provide additional properties, which can be accessed only by using collection syntax. If the data provider does not support the requested property or if the field is not found when the query is executed, the default value returned is NULL for **String Object** properties, 0 for [Integer \[XMLSCHEMA2-3.3.17\]](#) properties, and false for [Boolean \[XMLSCHEMA2-3.2.2\]](#) properties. The value of all predefined field properties is the data type specified in the following table. The value of all other properties is a **Variant**.

The following are all predefined properties of the [Field](#) object.

Property Name	Type	Expected Values
Value	Variant	

Property Name	Type	Expected Values
IsMissing	Boolean	
UniqueName	<a href="#">String [XMLSCHEMA2-3.2.1]</a>	
BackgroundColor	String	See <a href="#">Style.BackgroundColor</a>

FontFamily	String	See <a href="#">Style.FontFamily</a>
FontSize	String	See <a href="#">Style.FontSize</a>
FontWeight	String	See <a href="#">Style.FontWeight</a>
FontStyle	String	See <a href="#">Style.FontStyle</a>
TextDecoration	String	See <a href="#">Style.TextDecoration</a>
FormattedValue	String	
Key	Variant	
LevelNumber	Integer	
ParentUniqueName	String	

### 2.326.6.3 Fields Collection in Reports with Multiple Datasets

If a [Report](#) contains multiple datasets, there are multiple virtual [Fields](#) collections in the report. The context of the expression usage in the report MUST unambiguously specify which of these is accessed when referencing the **Fields** collection as one of the following three possible options:

- Inside of an aggregate, if the *Scope* argument refers to a dataset, **Fields** refers to the fields in that dataset.
- Within a data region, the **Fields** collection refers to the fields in the dataset for that region.
- Outside of a data region, direct references to fields (outside an aggregate) are undefined.

### 2.326.6.4 Parameters

The **Parameters** collection contains a set of [Parameter](#) objects (one **Parameter** object per [ReportParameter](#) specified in the report). The **Parameter** object specifies a set of predefined properties that, if referenced from an expression, MUST be accessed by using either the property syntax or the collection syntax (see [Fields](#)).

The only properties specified for **Parameter** are **Value**, **Label**, **Count**, and **IsMultiValue** as specified in the following table:

Property Name	Type	Specification
<b>Value</b>	<b>Variant</b> VariantArray	The <b>Value</b> property is determined by the parameter value input provided to the current report execution session. The data type of <b>Value</b> is a <b>Variant</b> for single-value parameters

Property Name	Type	Specification
		and <b>VariantArray</b> for multivalued parameters.
<b>Label</b>	<a href="#">String</a> [XMLSCHEMA2-3.2.1] <b>StringArray</b>	The <b>Label</b> property is determined by the value of the <b>Label</b> or <b>LabelField</b> element of the corresponding parameter value in the <b>ValidValues</b> list. The data type of <b>Label</b> is a <b>String</b> for single-value parameters and <b>StringArray</b> for multivalued parameters.
<b>Count</b>	<a href="#">Integer</a> [XMLSCHEMA2-3.3.17]	The <b>Count</b> property specifies the number of values and labels. The value of the <b>Count</b> property is 1 if it is not a multivalued parameter; it is 0 if the parameter does not have a value that is valid (or values have not yet been supplied).
<b>IsMultiValue</b>	<a href="#">Boolean</a> [XMLSCHEMA2-3.2.2]	The <b>IsMultiValue</b> property specifies whether the parameter is multivalued. The value of this property is <b>Boolean</b> .

### 2.326.6.5 ReportItems

Only text boxes appear as **ReportItem** objects in the **ReportItems** collection. <40>

The **ReportItem** object has a collection of predefined properties that, if referenced from expressions, MUST be referenced by using either the property syntax or the collection syntax (see the [Fields](#) object).

The only property defined for **ReportItem** is **Value**. The data type of **Value** is **Variant**.

The value of the current **ReportItem** MAY be referenced in property expressions by using **Me.Value** or simply **Value**. Aggregate functions MUST NOT include a reference to **Me.Value** or **Value**.

Expressions SHOULD NOT reference report items that are not defined at or above the current **grouping scope** (such as peer or descendent grouping scopes). If such a reference is used, the result is undefined.

The scope for expressions in page headers and page footers is considered to be items on the current page.

### 2.326.6.6 Globals

Members of the **Globals** collection are of type **Variant**, but individual members have the following known return types.

Property Name	Type	Specification
<b>PageNumber</b>	<a href="#">Integer</a> [XMLSCHEMA2-3.3.17]	Current page number. The member MUST NOT be referenced outside of the page header/footer of the report.
<b>TotalPages</b>	<b>Integer</b>	Total number of pages in the report. The member MUST NOT be referenced outside of the page header/footer of the report.
<b>ExecutionTime</b>	<a href="#">DateTime</a> [XMLSCHEMA2-3.3.17]	The date/time the report began executing.

Property Name	Type	Specification
	<a href="#">3.2.7]</a>	
<b>ReportServerUrl</b>	<a href="#">String [XMLSCHEMA2-3.2.1]</a>	URL to the report server, such as http://reportserver/reports.
<b>ReportFolder</b>	<b>String</b>	Full path on the report server to the folder containing the report. For example, for the report http://reportserver/reports/salesreports/budgeting/currentbudget, the <b>ReportFolder</b> is /salesreports/budgeting.
<b>ReportName</b>	<b>String</b>	Name of the report in the report catalog. For example, for the report http://reportserver/reports/salesreports/budgeting/currentbudget, the <b>ReportName</b> is "currentbudget".

### 2.326.6.8 DataSources

The **DataSources** collection contains a collection of [DataSource](#) objects. Only data sources used in the [Body](#) of the report are included in the **DataSources** collections. Data sources used only in parameter valid values and default values properties are not included.

The **DataSource** object specifies the following properties.

Property Name	Type	Specification
<b>Type</b>	<a href="#">String [XMLSCHEMA2-3.2.1]</a>	Type of data provider for the data source.
<b>DataSourceReference</b>	<b>String</b>	Path to the data source ( <b>Nothing</b> for embedded data sources).

### 2.326.6.9 DataSets

The **DataSets** collection contains a collection of [DataSet](#) objects. Only datasets used in the [Body](#) of the report are included in the **DataSets** collection. Datasets that are used only in parameter valid values and default values properties are not included.

The **DataSet** object specifies the following properties.

Property Name	Type	Specification
<b>CommandText</b>	<a href="#">String</a> <a href="#">[XMLSCHEMA2-3.2.1]</a>	The <b>CommandText</b> of the dataset.
<b>RewrittenCommandText</b>	<b>String</b>	The <b>CommandText</b> of the dataset after optionally rewritten by the report execution engine.

### 2.326.6.10 Variables

The [Variables](#) collection contains a collection of [Variable](#) objects (one object each per variable defined on report element and group elements).

The **Variable** object has a collection of predefined properties that, if referenced from expressions, MUST be accessed via either the property syntax or the collection syntax (see [Fields](#)).

The only property specified for **Variable** is **Value**. The data type of the **Value** property is **VARIANT**.

Expressions SHOULD NOT reference variables that are not defined at or above the current grouping scope (such as peer or descendent grouping scopes).

### 2.326.6.11 Restrictions on Use of Global Collections

The [Fields](#), [Parameters](#), [ReportItems](#), and [Globals](#) collections have restrictions on the contexts in which they can be used in expressions. The following table specifies where these global collections MAY ("Yes," or with restrictions specified below) or MUST NOT ("No") be used.

Usage Context	Global Collections					
	<b>Fields</b>	<b>ReportItems</b>	<b>Parameters</b>	<b>PageNumbers</b> <b>TotalPages</b>	<b>DataSource</b> <b>DataSet</b>	<b>Variables</b>
<b>Page Header / Footer</b>	Yes	Yes*	Yes	Yes	Yes	Yes
<b>Body</b>	Yes**	Yes***	Yes	No	Yes	Yes
<b>Report Parameter</b>	No	No	Yes****	No	No	No
<b>Field</b>	Yes	No	Yes	No	No	No
<b>Query Parameter</b>	No	No	Yes	No	No	No
<b>Group Expression</b>	Yes	No	Yes	No	Yes	No
<b>Sort Expression</b>	Yes	No	Yes	No	Yes	Yes*****
<b>Code</b>	No	No	Yes	No	No	No
<b>Report.Languag</b>	No	No	Yes	No	No	No

Usage Context	Global Collections					
<b>e</b>						
<b>Variables</b>	Yes	No	Yes	No	Yes	Yes***** *
<b>Aggregates</b>	Yes	Yes*****.	Yes	Yes*****.	Yes	No
<b>Lookup LookupSet</b>	Yes	Yes	Yes	Yes	Yes	No

\* MUST NOT contain more than one report item reference.

\*\* If an expression in a non-detail section refers to a field that is not in the group expression for the group (or any ancestor grouping scope), which specific value is used is not defined. The expression SHOULD use the First() and Last() aggregate functions.

\*\*\* MUST NOT contain report item references other than those in the current or ancestor scope.

\*\*\*\* MUST NOT contain parameter references to subsequent parameters.

\*\*\*\*\* Variable references in sort expressions MAY appear in [TablixMember](#), [DataMember](#), and [ChartMember](#) elements. Variable references MUST NOT appear in **DataRegion.SortExpressions**.

\*\*\*\*\* MUST NOT contain variable references other than those in the current or ancestor scope.

\*\*\*\*\* MUST NOT be used outside a page header/footer.

\*\*\*\*\* MUST NOT be used outside report item aggregates in a page header/footer.

Note that, because references to items in global collections can be dynamic, such as in "=ReportItems(Parameters!Param1.Value)", all error checking occurs both during report validation (to catch static disallowed references) and during report execution (to catch dynamic disallowed references).

Cyclic expressions (such as TextBox1=TextBox2+1; TextBox2=TextBox1+1) are treated as non-critical errors.

### 2.326.7 Aggregate Functions

RDL specifies the following standard aggregate functions:

**Sum, Avg, Max, Min, Count, CountDistinct, CountRows, StDev, StDevP, Var, VarP**

In addition, RDL specifies the following advanced aggregate functions:

**First, Last, Previous, RunningValue, RowNumber, Aggregate**

For all aggregate functions other than **First**, **Last**, and **Count**, the data type of the aggregated expression MUST be fixed.

Common parameters used by aggregate functions are specified in the following "Scope" and "Recursive" sections. A detailed specification for each aggregate function follows in subsequent sections.

### 2.326.7.1 Scope

There are three types of explicit scopes for expressions as follows:

- [DataSet](#) scope
- **DataRegion** scope
- [Grouping](#) scope

Explicit scopes (**DataSets**, **DataRegions**, and **Groups**) MUST have unique names.

In addition, there are three types of implicit scopes that do not have names:

- Top-level [Report](#) scope
- Page scope
- Cell scope (the intersection of the innermost row scope and innermost column scope)

Scopes represent a hierarchy. At any level in that hierarchy, there can be only one ancestor (except for the top-level report scope and the page scope), but an unlimited number of descendants as well as peer scopes. The "innermost scope" is specified as the position within that scope hierarchy relative to the current RDL expression.

The *Scope* parameter of an aggregate function MUST be a constant.

Three different report areas are distinguished for the *Scope* parameter:

For expressions inside data regions:

- Within a data region, the *Scope* argument MAY be omitted for all aggregates with the exception of [RunningValue](#) and [RowNumber](#).
- If omitted, the scope is determined as the innermost scope containing the report item in which the aggregate is used.

For expressions outside of data regions (in the report [Body](#)):

- When used outside of a data region, the scope, if specified, MUST refer to a dataset name.
- If more than one dataset exists in the report, the *Scope* argument MUST be specified.
- If exactly one dataset exists in the report, the *Scope* argument MAY be omitted.

For expressions in page headers and footers:

- If the *Scope* argument is omitted in page headers and footers, the scope is the data on the current page. In this case, report items MAY be used in an aggregate expression, but references to fields MUST NOT appear in the aggregate expression.
- If a scope is specified, fields MAY be used, but report items MUST NOT be used.

### 2.326.7.2 Recursive

Specifying an aggregate as recursive indicates that the aggregate applies to all data in the current instance of the given scope and all descendant instances of the current instance.

Recursive MAY be specified on standard aggregate functions: **Sum, Avg, Max, Min, Count, CountDistinct, CountRows, StDev, StDevP, Var, or VarP.**

Recursive SHOULD NOT be specified if the scope has no **Parent** property value specified on the group expression; if it is specified, it will be ignored.

The following table is an example of data aggregations, calculated without taking into account the recursive hierarchy ("Sales" column), and calculated with the recursive grouping based on ManagerID ("AllSales" column).

EmployeeID	ManagerID	Sales (Non Recursive)	AllSales (Recursive with Parent = ManagerID)
1	NULL	10	70
1a	1	10	30
1a1	1a	10	10
1a2	1a	10	10
1b	1	10	30
1b1	1b	10	10
1b2	1b	10	10

If the expression contains an aggregate, <b>Previous</b> aggregates the data within the previous instance of the <i>PreviousScope</i> that corresponds to the current instance of the aggregate's <i>Scope</i> . Function	Argument	Type	Specification
			reset whenever the group expression changes or reset with each new instance of the data region. A value of "Nothing" specifies that the running value never resets. The <i>Scope</i> argument MUST be a constant, not an expression.

\* The *Return* data type is determined by the function that is used in the *Function Enum* argument of the **RunningValue** call. For example, if **Sum** is used as *Function Enum* value for **RunningValue**, the return type follows the rules for the **Sum** function.

### 2.326.7.20 Aggregate Function: RowNumber

	<i>Expression</i>	<b>VARIANT</b>	The expression to aggregate. MUST be a simple field reference, for example: =Aggregate(Fields!Sales.Value,Year)
	<i>Scope</i>	<a href="#">String</a>	See the <a href="#">Sum</a> function. All group expressions for the <i>Scope</i> specified (and all containing group scopes) MUST be simple field references or (non-expression) constants.

### 2.326.7.22 Restrictions on Aggregate Usage

The following table specifies in which context a particular aggregate function call MAY ("Yes", or with restrictions specified below) or MUST NOT ("No") be used.

Group Expression	No	Yes	No	No	No	No	Yes
Sort Expression	No	No	No	No	Yes*	No	Yes
Tablix Cell	Yes**	Yes***	Yes	Yes	Yes	No	Yes

The scope of the running value/row number specifies the direction of the running value. **HideDuplicates** in a **TablixCell** has the same restrictions/behavior. **RunningValue**, **RowNumber**, and **HideDuplicates** in cells of a tablix MAY specify either column scopes or row scopes, but not both.

\*\*\* MUST NOT appear in **DataRegion.SortExpressions**.

### 2.326.7.23 Filtering and Aggregates

The behavior of filters and aggregate functions is specified as follows:

- Aggregates that use dataset scopes are applied after the dataset filter (if any) is applied to the data.
- Aggregates that use data region scopes are applied after the data region filter (if any) is applied to the data.
- Group filters are ignored for the purposes of calculating aggregates.
- The **Aggregate** aggregate function MUST NOT appear in a report that contains any [Filter](#) elements.
- **First**, **Last**, **Previous**, **RunningValue**, and **RowNumber** are applied after containing data region and group filters are applied.

### 2.326.7.24 Additional Functions

This section describes additional functions that can be referenced from expressions.

### 2.326.7.24.1 Dynamic Scoping

Report items contained within a cell of a [Tablix](#) that has automatic subtotals (as a result of a drilldown) have dynamic scoping.

For example, consider a tablix that has a Year column group and a Product row group. If the value of the text box in the detail cell is =Sum(Fields!Sales.Value), each detail cell will be grouped on both year and product. However, the year subtotal (shown when the Year group is hidden) will be grouped only on product and the product subtotal will be grouped only on year (and the grand total will not be grouped on either).

The [InScope](#) function can be used to determine what the current instance is grouped on.

### 2.326.7.24.2 Function: InScope

Function	Arguments	Type	Specification
<b>InScope</b>	<i>Return</i>	<a href="#">Boolean</a>	Returns true if the current instance is within the specified scope. Otherwise, returns false.
	<i>Scope</i>	<a href="#">String</a>	Name of a dataset, group, or data region.

A typical use for the **InScope** function is to construct links to drillthrough reports that will work in both tablix detail cells and automatic subtotal cells, as in the following example.

```
<Drillthrough>
<ReportName>=iif (InScope ("Month"), "Transactions", "ProductTotByYear") </ReportName>
<Parameters>
<Parameter Name=Year>
<Value>=Fields!Year</Value>
<Omit>=Not (InScope ("Year"))</Omit>
</Parameter>
<Parameter Name=Month>
<Value>=Fields!Month</Value>
<Omit>=Not (InScope ("Month"))</Omit>
</Parameter>
<Parameter Name=Product>
<Value>=Fields!Product</Value>
<Omit>=Not (InScope ("Product"))</Omit>
</Parameter>
</Parameters>
</Drillthrough>
```

### 2.326.7.24.3 Semantic Query Drillthrough

For reports with semantic queries that use automatic drillthrough query rewriting, the function [CreateDrillthroughContext](#) is available to generate a default drillthrough context.

### 2.326.7.24.4 Function: CreateDrillthroughContext

Function	Arguments	Type	Specification
<b>CreateDrillthroughContext</b>	<i>Return</i>	<a href="#">String</a>	Returns a <b>DrillthroughContext</b> parameter value that specifies the current drillthrough context, including semantic query fields from the

Function	Arguments	Type	Specification
			current scope referenced in the <b>Value</b> property of the current object (text box, image, or chart data point) and semantic query field values for the current group scopes.

This function call MUST NOT appear outside a drillthrough parameter value expression. Otherwise, the result is undefined.

### 2.326.7.24.5 Function: Lookup

*Applies to RDL Schema 2009/01 (section [5.4](#)) and later only*

Lookup functions (**Lookup**, **LookupSet**, and **MultiLookup**) provide the ability to take a value from the current scope and find a corresponding value or collection of values within a specified dataset. This is typically used in reports for converting codes into human-readable labels.

Function	Arguments	Type	Description
<b>Lookup</b>	<i>Return</i>	<b>Variant</b>	<b>Lookup</b> evaluates the <i>Source</i> expression for the current instance of the current scope. It then finds the first row of data in the specified <i>Dataset</i> * for which the source value equals the <i>Destination</i> expression evaluated for that row.** It returns the value of the <i>Result</i> expression evaluated for that row, or NULL if no matching row is found. The <i>Return</i> data type is the same as the <i>Result</i> data type.
	<i>Source</i>	<b>Variant</b>	Specifies the value to look up. The <i>Source</i> expression result MUST match the data type of the <i>Destination</i> expression. The expression MUST NOT reference lookup functions.***
	<i>Destination</i>	<b>Variant</b>	Specifies the value to compare the <i>Source</i> expression to. The <i>Destination</i> expression MUST NOT reference aggregate functions, report items, or lookup functions.
	<i>Result</i>	<b>Variant</b>	The <i>Result</i> expression MUST NOT reference aggregate functions, report items, or lookup functions.
	<i>Dataset</i>	<a href="#">String</a>	Name of the dataset in which to evaluate the <i>Destination</i> expression and <i>Result</i> expression. MUST be a constant, not an expression.

\* After *Dataset* filters have been applied.

\*\* The comparison SHOULD use collation settings from the *Dataset*.

\*\*\* "Lookup functions" refers to all types of lookup functions (such as **Lookup**, **LookupSet**, and **MultiLookup**).

### 2.326.7.24.6 Function: LookupSet

*Applies to RDL schema 2009/01 (section [5.4](#)) and later only*

The main difference between **Lookup** and **LookupSet** is that the latter returns all matching values, instead of only the first match.

Function	Arguments	Type	Description
<b>LookupSet</b>	<i>Return</i>	<b>VariantArray</b>	<p><b>LookupSet</b> evaluates the <i>Source</i> expression for the current instance of the current scope.</p> <p>It then finds all rows of data in the specified dataset17 for which the source value equals the <i>Destination</i> expression evaluated for that row18.</p> <p>It returns an array containing a list of all values of the <i>Result</i> expression evaluated for each matching row, or an empty array if no matching rows are found. The list retains the order of the rows in the original dataset.</p> <p>Elements of the <i>Return</i> array MUST be the same data type as the <i>Result</i> data type.</p>
	<i>Source</i>	<b>Variant</b>	<p>Specifies the value to look up.</p> <p>The value of the expression result MUST match the data type of the <i>Destination</i> expression.</p> <p>The expression MUST NOT reference lookup functions17.</p>
	<i>Destination</i>	<b>Variant</b>	<p>Specifies the value to compare the <i>Source</i> expression to.</p> <p>The <i>Destination</i> expression MUST NOT reference aggregate functions, report items, or lookup functions17.</p>
	<i>Result</i>	<b>Variant</b>	<p>The <i>Result</i> expression MUST NOT reference aggregate functions, report items, or lookup functions17.</p>
	<i>DataSet</i>	<a href="#">String [XMLSCHEMA2-3.2.1]</a>	<p>Name of the dataset in which to evaluate the <i>Destination</i> expression and <i>Result</i> expression. MUST be a constant, not an expression.</p>

#### 2.326.7.24.7 Function: MultiLookup

**Applies to RDL schema 2009/01 (section 5.4 ) and later only**

The items in</p>

Function	Arguments	Type	Description
			the array retain the order of the items in the <i>Source</i> array. Elements of the <i>Return</i> array MUST be the same data type as the <i>Result</i> type.
	<i>Source</i>	<b>VariantArray</b> <a href="#">&lt;42&gt;</a>	The value to look up. Items in the array MUST match the data type of the <i>Destination</i> expression. The expression MUST NOT reference lookup functions.*

The following sections provide examples for the structures defined in the RDL file format specification. Examples of the RDL file format include examples that demonstrate defining the major components of a report; these include defining the report, the data, and various report items.

#### 3.1 Report in RDL schema 2008/01

The following is an example of the RDL for a report in RDL schema 2008/01 [MS-RDL200801]. It shows the usage of the various properties of a [Report](#). The example uses elements for describing the data: [DataSources](#) and [DataSets](#); elements for describing the structure and layout: [Page](#), including [Page.PageHeader](#) and [Page.PageFooter](#), and [Body](#); and elements for describing the [ReportParameters](#) and [Variables](#) for the report.

The following figure shows an example rendering of this report.

### 3.4 Column and Line Chart Examples

**Applies to RDL schemas 2008/01 [\[MS-RDL200801\]](#) and later**

The following example report shows two independent charts. The first [Chart](#)—referenced as Chart1—starts from line 90 to line 379 in the RDL example at the end of this topic.

**Figure 11: Chart1 example**

This is a column chart with one set of series and series grouping. To understand how this chart is bound to data, consider the following table that shows the data that this chart displays.

Product category name	Year	Quantity
Accessories	2001	1003
	2002	27207
	2003	23734
	2003	103978
	2004	292660
Bikes	2001	14256
	2002	49810
	2003	30773
	2003	43241
	2004	42456
Clothing	2001	2132
	2002	16927
	2003	16515
	2003	18862
	2004	19234

Product category name	Year	Quantity
Components	2001	75892
	2002	332885
	2003	266860
	2003	314930
	2004	661065

The [Query](#) and the data fields are specified from line 10 to line 44. **Chart** is bound to the [DataSet](#) "SalesPerProduct" (see line 366).

The category axis displays the value of the Year column, the value axis displays the value of the Quantity column, and the data values are grouped by the Product category name column.

The category hierarchy is specified from line 91 to line 102; the series hierarchy is specified from line 103 to line 123.

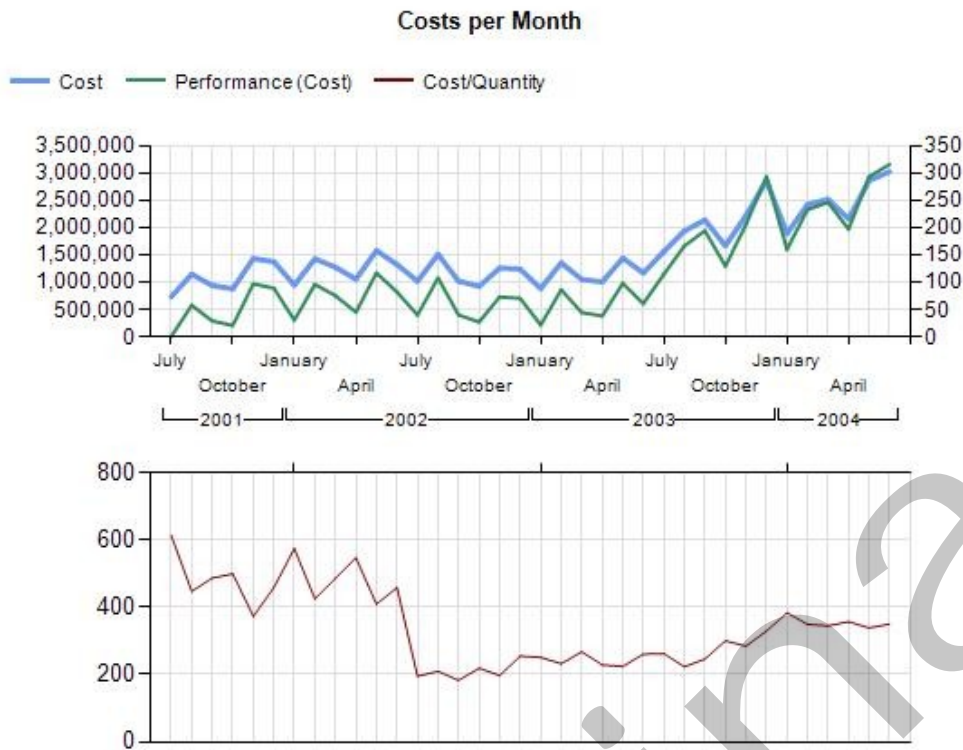

Note that the last product category in the table is not displayed in the chart. There is a filter applied to the series grouping (lines 110 to 118) to skip every row of the dataset where the product category name equals to "Components".

This chart has only one set of series specified (its name is "Quantity") in the [ChartSeriesCollection](#) element (lines 125 to 167).

Because this is a 3D chart with the projection mode set to "Perspective", 3D properties are specified from line 308 to line 313, except for the shape of the columns, which is specified by custom properties for the series (from lines 154 to 159).

The second chart (specified as Chart2 from line 380 to line 898) displays three series (one of them is calculated) with nested category grouping. This example also shows how to use secondary axes and how to align chart areas to match gridlines.

**Figure 12: Chart2 example**

Chart2 has two chart areas:

- Chart area "Default" (lines 533 to 676) displays series (*Cost*) and calculated series (*Performance (Cost)*).
- "ChartArea2" (lines 677 to 835) displays the *Cost/Quantity* series; it is aligned to chart area one on the inner plot position (line 830 to line 834).

Note that on the first chart area, the category axis displays a hierarchy of years and months. To understand this behavior, consider the following table that shows a subset of data applied to the chart. (The query and the data fields are specified from line 45 to line 87. The **Chart** is bound to the **DataSet** "CostsPerMonth".)

Year	Month	Cost	Quantity
2001	7	726727.4476	1187
	8	1142665.9223	2560
	9	934633.6329	1924
	10	873968.9087	1754
	11	1427743.5228	3837
	12	1369873.0300	2994

Year	Month	Cost	Quantity
2002	1	945210.0341	1649
	2	1421680.2332	3355
	3	1270261.5659	2620
	4	1051384.7585	1927
	5	1573531.6562	3854
	6	1318811.3400	2884
	7	1013621.4783	5226
	8	1506516.6655	7227
	9	1014436.2328	5582
	10	920017.4347	4223
	11	1253971.9866	6396
	12	1235027.0052	4867

This table has two columns that are used for category grouping. Look at the embedded category members from line 381 to line 402. Also notice that—although this chart has no series grouping—two static members are specified in the series hierarchy (lines 403 to 412).

The hierarchy of category groups is automatically reflected on the category axis: Year is the parent group, and Month is the child group; therefore, **Axis** does not need any alteration.

As previously mentioned, the first chart area displays two series. The second set of series is calculated, which means that it takes the values of the first series and, depending on the formula that is applied, displays its values as a different series.

The calculated series (Series1) is specified from line 492 to line 530. Note that calculated series need references to the series they're applied to (line 527). Because the values of the calculated series are in a different range, the secondary axis is used. To achieve this, it is sufficient to assign the series to the secondary value axis (line 520) as long as the [Visible](#) property of the related axis is set to "Auto" (because "Auto" is the default value for the **Visible** element, it is not present in the RDL file).

The second area shows two category axes. Because this chart area is aligned to the previous one and the chart displays values in the same range, it is not necessary to show anything on any of the axes. Instead, the primary axis of the first chart area is reused.

The primary axis is enabled to display a frame at the bottom of the chart area, but it does not display labels (see line 715).

The secondary axis, however, is visible (line 718), and the [ChartMajorTickMarks](#) elements' [Interval](#) and [IntervalOffset](#) properties are used to display tick marks for the first month for each year (from lines 744 to 748).

### 3.5 Doughnut Chart Example

Applies to RDL schemas 2003/10 [MS-RDL200310] and 2005/01 [MS-RDL200501] only

The following sample report shows a doughnut chart.

**Figure 13: Doughnut chart example**

The following table shows the data that this chart is bound to.

Product category name	Year	Quantity
Accessories	2001	1003
	2002	27207
	2003	23734
	2003	103978
	2004	292660
Bikes	2001	14256
	2002	49810
	2003	30773
	2003	43241
	2004	42456
Clothing	2001	2132
	2002	16927
	2003	16515
	2003	18862

Product category name	Year	Quantity
	2004	19234
Components	2001	75892
	2002	332885
	2003	266860
	2003	314930
	2004	661065

This chart shows the sum of the quantity for each product category regardless of the year. The following RDL snippet shows how the chart is specified to display data the way it looks in the preceding picture.

```
<Chart Name="chart1">
  <DataSetName>SalesPerProduct</DataSetName>
  <PointWidth>0</PointWidth>
  <Palette>Pastel</Palette>
  <Subtype>Plain</Subtype>
  <Type>Doughnut</Type>
  <Top>0.125in</Top>
  <Left>0.125in</Left>
  <Width>6.25in</Width>
  <Height>3.125in</Height>
  <CategoryAxis />
  <ValueAxis />
```

This is a doughnut chart bound to a [DataSet](#) that is called "SalesPerProduct" with a Pastel palette.

```
<SeriesGroupings>
  <SeriesGrouping>
    <DynamicSeries>
      <Grouping Name="chart1_SeriesGroup1">
        <GroupExpressions>
          <GroupExpression>=Fields!ProductCategoryName.Value</GroupExpression>
        </GroupExpressions>
      </Grouping>
      <Label>=Fields!ProductCategoryName.Value</Label>
    </DynamicSeries>
  </SeriesGrouping>
</SeriesGroupings>
```

The series grouping specifies that each Product Category value is in the legend. Note that the [Label](#) element specifies the text of the item in the legend. The number of the series groups is the number of slices in the chart. The sizes of the slices are determined by the following value.

```
<ChartData>
  <ChartSeries>
```

```

<DataPoints>
  <DataPoint>
    <DataValues>
      <DataValue>
        <Value>=Sum (Fields!Quantity.Value) </Value>
      </DataValue>
    </DataValues>
    <DataLabel>
      <Style />
      <Value>=Fields!Quantity.Value</Value>
      <Position>BottomRight</Position>
      <Visible>true</Visible>
    </DataLabel>
  </DataPoint>
</DataPoints>
</ChartSeries>
</ChartData>

```

As shown in the figure, each slice has its value displayed as a [DataLabel](#) element as specified in the above RDL.

```

<Legend>
  <Visible>true</Visible>
  <Style>
    <BorderStyle>
      <Default>Solid</Default>
    </BorderStyle>
  </Style>
  <InsidePlotArea>true</InsidePlotArea>
</Legend>

```

The [Legend](#) element is displayed inside the [PlotArea](#) element with the gradient background color specified by the **PlotArea** element in the following RDL.

```

<PlotArea>
  <Style>
    <BackgroundColor>LightGrey</BackgroundColor>
    <BackgroundGradientType>TopBottom</BackgroundGradientType>
    <BorderStyle>
      <Default>Solid</Default>
    </BorderStyle>
  </Style>
</PlotArea>

```

Because this is a 3D chart, the [ThreeDProperties](#) element must be specified as well in the following RDL.

```

<ThreeDProperties>
  <Enabled>true</Enabled>
  <Rotation>30</Rotation>
  <Inclination>30</Inclination>
  <Shading>Real</Shading>

```

```
<WallThickness>50</WallThickness>
</ThreeDProperties>
```

The following RDL specifies the chart title text and the chart style.

```
<Style>
  <BackgroundColor>White</BackgroundColor>
</Style>
<Title>
  <Caption>Sales per Product Category</Caption>
</Title>
</Chart>
```

### 3.6 CustomReportItem Example

The following is an example RDL definition of a [CustomReportItem](#) for the RDL schema 2008/01 [MS-RDL200801] version of the element, with its data. The example is based on the Microsoft Polygons example available at [MSDN-RDLDT]. The rendered snippet is pictured in the following figure.

**Figure 14: A data source is defined as embedded XML.**

```
<DataSources>
  <DataSource Name="PolygonsData">
    <ConnectionProperties>
      <DataProvider>XML</DataProvider>
      <ConnectionString />
    </ConnectionProperties>
  </DataSource>
</DataSources>
```

A single [DataSet](#) element is defined with five [Fields](#) elements, named in both the [Query](#) and the [Report](#) as "Object", "Color", "Point", "X", and "Y".

```
<DataSets>
  <DataSet Name="DataSet1">
```

```

<Fields>
  <Field Name="Object">
    <DataField>Object</DataField>
  </Field>
  <Field Name="Color">
    <DataField>Color</DataField>
  </Field>
  <Field Name="Point">
    <DataField>Point</DataField>
  </Field>
  <Field Name="X">
    <DataField>X</DataField>
  </Field>
  <Field Name="Y">
    <DataField>Y</DataField>
  </Field>
</Fields>
<Query>
  <DataSourceName>PolygonsData</DataSourceName>

```

The [Query.CommandText](#) element contains the XML. Note that the XML brackets ("`<`" and "`>`") have had to be replaced with encoded versions ("`&lt;`" and "`&gt;`") to avoid confusing an RDL reader. The following table illustrates the data.

Object	Color	Point	X	Y
1	Red	1	75	75
1	Red	2	75	175
1	Red	3	175	175
1	Red	4	175	75
2	Blue	1	75	25
2	Blue	2	25	112
2	Blue	3	125	112

**Figure 15:**

<ElementPath>Rows/Row{Object(Integer),Color(String),Point(Integer),X(Integer),Y(Integer)}</ElementPath>
</Query>
</CommandText>
</Query>
</DataSet>
</DataSets>

```

The **CustomReportItem** element has its [CustomReportItem.Name](#) attribute set to "customReportItem1". It is set to 0.125 inches from the top of its containing object (either the [Body](#) or a report item) and, because no [CustomReportItem.Left](#) element is defined, the position of its left is the position of the left of its containing object. The custom report item will be 2 inches high and 10 centimeters wide.

```

<CustomReportItem Name="customReportItem1">
  <Top>0.125in</Top>
  <Height>2in</Height>
  <Width>10cm</Width>

```

The [CustomReportItem.Type](#) of the element is set to a name recognizable by the rendering engine, so that custom code to render this item can be utilized. The [CustomData.DataSetName](#) element points to the prepared data.

```

<Type>Polygons</Type>
<CustomData>
  <DataSetName>DataSet1</DataSetName>

```

A [CustomData.DataColumnHierarchy](#) element must be defined, although this example only has one column hierarchy, which covers all rows.

```

<DataColumnHierarchy>
  <DataMembers>
    <DataMember />
  </DataMembers>

```

```
</DataColumnHierarchy>
```

The [DataRowHierarchy](#) element is also mandatory and in this case uses a two-level hierarchy to separate the two objects, so that the lower hierarchy is processed for each object in turn.

```
<DataRowHierarchy>  
  <DataMembers>
```

The outer [DataMember](#) element is specified with a [Group](#) that is named "Object", which groups on the value of the Object field. The **DataMember** has two [CustomProperty](#) elements defined. The name of these custom properties is only relevant to the custom code, which must look for and match "poly:Color" and "poly:Hyperlink". The value of the first custom property is set to the value of the Color field from the data set; the value of the second custom property is set to a URL that is intended to be set as the [Action](#) of an [Image](#) that the custom code will create.

```
<DataMember>  
  <Group Name="Object">  
    <GroupExpressions>  
      <GroupExpression>=Fields!Object.Value</GroupExpression>  
    </GroupExpressions>  
  </Group>  
  <CustomProperties>  
    <CustomProperty>  
      <Name>poly:Color</Name>  
      <Value>=Fields!Color.Value</Value>  
    </CustomProperty>  
    <CustomProperty>  
      <Name>poly:Hyperlink</Name>  
      <Value>http://microsoft.com</Value>  
    </CustomProperty>  
  </CustomProperties>
```

Within the outer [DataMember](#) element, an inner [DataMembers](#) collection is specified. A single **DataMember** descendant is specified.

```
<DataMembers>  
  <DataMember>
```

A [Group](#) element is specified so that a sort can be defined. Since the data is known to be good, no grouping expression is specified. The data is sorted on the value of the Point field.

```
    <Group Name="Point" />  
    <SortExpressions>  
      <SortExpression>  
        <Value>=Fields!Point.Value</Value>  
      </SortExpression>  
    </SortExpressions>  
  </DataMember>  
</DataMembers>
```

```

    </DataMember>
  </DataMembers>
</DataRowHierarchy>

```

There is only one leaf **DataMember** in the **DataRowHierarchy**, so there is only one [DataRow](#) element specified. The row has two cells in it, specifying X and Y data based on the value of the X and Y fields.

```

<DataRows>
  <DataRow>
    <DataCell>
      <DataValue>
        <Name>X</Name>
        <Value>=Fields!X.Value</Value>
      </DataValue>
      <DataValue>
        <Name>Y</Name>
        <Value>=Fields!Y.Value</Value>
      </DataValue>
    </DataCell>
  </DataRow>
</DataRows>
</CustomData>

```

Further values are specified for the custom code by using a [CustomProperties](#) element to define four name/value pairs. Again, the value of the [Name](#) element must be matched in code and has no relevance to any namespace. The value of each [Value](#) element could be expressed as a literal or as an expression.

```

<CustomProperties>
  <CustomProperty>
    <Name>poly:MaxX</Name>
    <Value>200</Value>
  </CustomProperty>
  <CustomProperty>
    <Name>poly:MinX</Name>
    <Value>0</Value>

  </CustomProperty>
  <CustomProperty>
    <Name>poly:MinY</Name>
    <Value>0</Value>
  </CustomProperty>
</CustomProperties>

```

A [Style](#) element specifies a background color that the custom code may use. It also specifies a default foreground color for the custom code to use. The empty [Border](#) element has no effect.

```

<Style>
  <Border />
  <BackgroundColor>Yellow</BackgroundColor>
  <Color>Red</Color>
</Style>

### 3.7 Tablix Example 1

The following is an example RDL definition of a [Tablix](#) element that is used in a very simple manner. The tablix acts as a container for a [Rectangle](#); the rectangle contains the report layout. This layout provides similar functionality to the [List](#) element in versions of RDL prior to 2008/01 [\[MS-RDL200801\]](#). The data is fetched from the Microsoft AdventureWorks example database. An extract of the rendered XML is as follows.

#500-75 O'Connor Street Ottawa	Ontario Canada K4B 1S2
#9900 2700 Production Way Burnaby	British Columbia Canada V5A 4X1
1050 Oak Street Seattle	Washington United States 98104

123 Camelia Avenue Oxnard	California United States 93030
123 W. Lake Ave. Peoria	Illinois United States 61606

**Figure 16: Tablix example 1**

The **Tablix** element has its [Tablix.Name](#) attribute set to "Tablix1". It has a single uncomplicated column, needing only the minimal [TablixColumnHierarchy](#). The [TablixRowHierarchy](#) is almost as simple, but because the single tablix row is to be repeated for each row of data, the [TablixMember](#) is defined with a [Group](#). There is no grouping, filtering, or sorting to be done on the **Group**, which defines it as a detail group.

```

<Tablix Name="Tablix1">
  <TablixColumnHierarchy>

        <Group Name="Details" />
      </TablixMember>

The single column is set to be 5.5 inches wide; therefore, the tablix is going to be 5.5 inches wide.

The single row specifies a single [TablixCell](#)—because there is only a single column—and this has a **Rectangle** in it. The rectangle has various controls in it. For each row of data, the cell is repeated vertically, each being 0.42 inches high. The rendered height of the tablix depends on how many rows of data are in the [DataSet](#).

### 3.8 Tablix Example 2

The following is an example RDL definition of a [Tablix](#) element that is used to lay out data in a straightforward manner. The tablix uses text boxes within cells to format and display the data. This layout provides similar functionality to the [Table](#) element in versions of RDL prior to 2008/01. The data is fetched from the Microsoft AdventureWorks example database. The top of the rendered definition is shown in the following figure.

## Figure 17: Tablix example 2

The **Tablix** element has its [Tablix.Name](#) attribute set to "Tablix2". It is positioned 1 inch from the left edge of its container.

```
<Tablix Name="Tablix2">
  <Left>1in</Left>
```

The entire tablix should be rendered only if the value of the *ShowTable* parameter is set to false. If it is rendered, a page break is wanted before the tablix appears, and after the last row of the rendered tablix, another page break is wanted.

```
<Visibility>
  <Hidden>=Parameters!ShowTable.Value=False</Hidden>
</Visibility>
<PageBreak>
  <BreakLocation>StartAndEnd</BreakLocation>
</PageBreak>
```

There are three static columns in this tablix, so there must be three [TablixCell](#) elements in each row (or fewer if one of the cells spans more than one column).

```
<TablixColumnHierarchy>
  <TablixMembers>
    <TablixMember />
    <TablixMember />
    <TablixMember />
  </TablixMembers>
</TablixColumnHierarchy>
```

The [TablixRowHierarchy](#) element specifies two rows. The first is a static row that is to be kept with the dynamic row that follows. This row is to behave as a column header. Therefore, the row has a [TablixMember.KeepWithGroup](#) element that has a value of After and a [TablixMember.RepeatOnNewPage](#) element that has a value of true.

```
<TablixRowHierarchy>
  <TablixMembers>
    <TablixMember>
      <KeepWithGroup>After</KeepWithGroup>
      <RepeatOnNewPage>true</RepeatOnNewPage>
    </TablixMember>
```

The second row is a detail group with a [SortExpression](#) that causes the data in the group to appear in order of city name, A-Z.

```
<TablixMember>
  <Group Name="Details" />
  <SortExpressions>
```

```

        <SortExpression>
            <Value>=Fields!City.Value</Value>
        </SortExpression>
    </SortExpressions>
</TablixMember>
</TablixMembers>
</TablixRowHierarchy>

```

The three columns defined by the [TablixColumnHierarchy](#) are set up with specific widths.

The first row is set to 0.3 inches high and contains three cells. Each cell has an aqua background and has a light gray border, created by setting the properties on the descendant text boxes. The text in each text box is set as a header to the columns, Address, City, and Country.

The second row is associated with the row hierarchy that is a detail group; it will therefore be repeated for each row of data. The second dynamic column is grouping on the Order Date month. The [DataSet](#) contains data for only a single month. Therefore, the example renders only a single column for this **dynamic group**. The size of the **TablixHeader** element is equal to the sum of the sizes of the first dynamic column headers. This effectively means that the [CellContents](#) span two rendered header rows. The text box is colored pink.

</TablixRowHierarchy>

```

A [TablixCorner](#) element is specified (colored lime in the preceding figure) to occupy the top left corner. Observe that there is no ability to specify width or heights within the **TablixCorner**. The width of the columns is defined by the size of the **TablixHeader** elements in the row hierarchy. The height of the rows is defined by the size of the **TablixHeader** elements in the column hierarchy.

```

<TablixCorner>
    <TablixCornerRows>

```

There are two [TablixCornerRow](#) elements specified. There must be two because of the rule that states the following:

"If a **TablixCorner** element is specified, the quantity of descendant **TablixCornerRow** elements in the tablix MUST equal the quantity of unique cumulative heights for each tablix column member of the tablix. 'Cumulative height' for a tablix column member is defined as the sum of the values of all [TablixHeader.Size](#) elements descendant of the tablix column member."

Column hierarchy	Size	Cumulative height
Tablix member (SalesPerson)	.43438	.43438
Tablix member "List Price"	.43438	.43438 + .45833 = .94721

Column hierarchy	Size	Cumulative height
Tablix member "Standard Cost"	.43438	.43438 + .45833 = .94721
Tablix member (SalesPerson)	.94721	.94721

### Computation of quantity of TablixCornerRow elements

This table shows the structure of the **TablixHeaders** within the column hierarchy, identifying the size values. The cumulative height calculation shows the addition of the **RdlSize** with all of its parent's **RdlSizes**. There are two unique cumulative heights: these are .48438 and .94721. Therefore, there must be two **TablixCornerRow** elements.

There are two [TablixCornerCell](#) elements specified in each row. There must be two because of the rule that states:

"If a **TablixCornerRow** element is specified, the quantity of descendant **TablixCornerCell** elements in the tablix MUST equal the quantity of unique cumulative widths for each tablix row member of the tablix. 'Cumulative width' for a tablix row member is defined as the sum of the values of all **TablixHeader.Size** elements that are descendant of the tablix row member."

Row hierarchy	Size	Cumulative width
Tablix member (ProductCategoryName)	1.00000	1.00000
Tablix member "First order received"	1.76562	1.00000 + 1.76562 = 2.76562
Tablix member (ProductName)	1.76562	1.00000 + 1.76562 = 2.76562
Tablix member "Total"	1.76562	1.00000 + 1.76562 = 2.76562

### Tablix example 3—computation of quantity of TablixCornerCell elements

The preceding table shows the structure of the **TablixHeaders** within the row hierarchy, identifying the size values. The cumulative width calculation shows the addition of the size with all of its parent's sizes. There are two unique cumulative heights: these are 1.00000 and 1.76562. Therefore, there need to be two **TablixCornerCell** elements in each **TablixCornerRow** element.

### 3.10 Data Example

The following is an example that shows how to define the data that will be used for the [Report](#) element. The example shows a [DataSource](#) and [DataSet](#) definition, including the [Query](#), which has [QueryParameters](#) that reference [ReportParameters](#), and the [Fields](#) for the **DataSet**, with one field being calculated based on two other fields in the **Fields** collection.

```

### 3.11 Subreport Example

The following RDL definition shows an example of a [Subreport](#) definition that would be used within a data region. The example includes specifying the location of the report definition to use for the subreport by specifying the path by using the [Subreport.ReportName](#) element. The report being referenced requires three report parameters to be supplied with values, which are specified by using the [Subreport.Parameters](#) element.

```

<Subreport Name="Subreport1">
    <ReportName>/Subreports/CustomerOrder.rdl</ReportName>

```

```

<Parameters>
  <Parameter Name="CustomerID">
    <Value>=Fields!CustomerID.Value</Value>
  </Parameter>
  <Parameter Name="OrderID">
    <Value>=Fields!OrderID.Value</Value>
  </Parameter>
  <Parameter Name="ShowDetails">
    <Value>=(Count(Fields!OrderID.Value) < 5)</Value>
  </Parameter>
</Parameters>
<Top>0.69667in</Top>
<Left>0.43625in</Left>
<Height>2.61458in</Height>
<Width>4.77083in</Width>
<ZIndex>1</ZIndex>
</Subreport>

```

### 3.12 TextBox Example

The following is an example text box that was created by using the [Textbox](#) element.

**Figure 19: Text box example**

The [Name](#) attribute of the **Textbox** element is set to "Textbox1". "Textbox1" has its [Textbox.CanGrow](#) element set to true. This means that, although the [Textbox.Height](#) element is set

to only 0.72917 inches, extra spacing or padding introduced by other elements within "Textbox1" can make "Textbox1" grow vertically beyond 0.72917 inches. "Textbox1" contains four [Paragraph](#) elements within its [Paragraphs](#) collection.

```
<Textbox Name="Textbox1">
  <CanGrow>true</CanGrow>
  <KeepTogether>true</KeepTogether>
  <Paragraphs>
```

The first **Paragraph** in the **Paragraphs** collection for "Textbox1" contains two [TextRun](#) elements, which correspond separately to the words "Hello" and "World". The **TextRun** element that has [TextRun.Value](#) set to "Hello" has [Style.Color](#) set to "Blue". The **TextRun** element that has [TextRun.Value](#) set to "World" has [Style.Color](#) set to "Red".

```
<Paragraph>
  <TextRuns>
    <TextRun>
      <Value>Hello</Value>
      <Style>
        <Color>Blue</Color>
      </Style>
    </TextRun>
    <TextRun>
      <Value> World</Value>
      <Style>
        <Color>Red</Color>
      </Style>
    </TextRun>
  </TextRuns>
  <ListStyle>Numbered</ListStyle>
  <ListLevel>1</ListLevel>
```

Because [Style.LineHeight](#) is set to "1in", each **Paragraph** within "Textbox1" takes up at least one inch of vertical space. Because **Textbox.CanGrow** is set to true, "Textbox1" actually is much larger in height than its specified **Textbox.Height** value of 0.72971 inches.

```
<Style>
  <LineHeight>1in</LineHeight>
</Style>
</Paragraph>
<Paragraph>
  <TextRuns>
    <TextRun>
      <Value>A</Value>

        <Color>Red</Color>
      </Style>
    </TextRun>
  </TextRuns>
  <ListStyle>Numbered</ListStyle>
  <ListLevel>1</ListLevel>
  <Style>
    <LineHeight>1in</LineHeight>

</Style>
</Paragraph>
<Paragraph>

      <Style>
        <Color>Red</Color>
      </Style>
    </TextRun>
  </TextRuns>
  <ListStyle>Numbered</ListStyle>
  <ListLevel>1</ListLevel>
  <Style>
    <LineHeight>1in</LineHeight>
  </Style>
</Paragraph>
<Paragraph>
  <TextRuns>
    <TextRun>
      <Value>C</Value>
      <Style>
        <Color>Red</Color>
      </Style>
    </TextRun>
  </TextRuns>
  <ListStyle>Numbered</ListStyle>
  <ListLevel>1</ListLevel>
  <Style>
    <LineHeight>1in</LineHeight>
  </Style>
</Paragraph>
<Paragraph>
  <TextRuns>
    <TextRun>
      <Value />
      <Style>
        <Color>Red</Color>
      </Style>
    </TextRun>
  </TextRuns>
  <ListLevel>1</ListLevel>
  <Style />
</Paragraph>
</Paragraphs>
<rd:DefaultName>Textbox1</rd:DefaultName>
<Top>0.85292in</Top>
<Left>2.19667in</Left>
<Height>0.72917in</Height>
<Width>1.84375in</Width>

```

"Textbox1" has a [Style.TopBorder](#) element with [Border.Style](#) set to "Blue", **Border.Style** set to "Double", and [Border.Width](#) set to "5pt". Because these properties are set only for **Style.TopBorder**, and no other [Style](#) border elements or a generic [Style.Border](#) element, the left, right, and bottom sides of "Textbox1" are not affected. This is shown in the figure at the beginning of this section. Additionally, "Textbox1" has [Style.Direction](#) set to "RTL", which is why the numbering in the list within "Textbox1" occurs to the right of the actual text.

```

<Style>
  <Border>
    <Style>None</Style>
  </Border>
  <TopBorder>
    <Color>Blue</Color>
    <Style>Double</Style>
    <Width>5pt</Width>
  </TopBorder>
  <BackgroundColor>Yellow</BackgroundColor>
  <TextAlign>Center</TextAlign>
  <PaddingLeft>2pt</PaddingLeft>
  <PaddingRight>2pt</PaddingRight>
  <PaddingTop>2pt</PaddingTop>
  <PaddingBottom>2pt</PaddingBottom>
  <Direction>RTL</Direction>
</Style>
</Textbox>

```

### 3.13 GaugePanel Example

The following is an example RDL definition of a [GaugePanel](#) element that is used to create the gauge panel shown in the following figure. The **GaugePanel** element has its [Name](#) attribute set to "GaugePanel3". "GaugePanel3" has the [GaugePanel.DataSetName](#) element set to "DataSet1". The [DataSet](#) named "DataSet1" exposes two [Fields](#) named "UnitsInStock" and "UnitsOnOrder" for "GaugePanel3" to use.

**Figure 20: Gauge panel with single radial gauge**

The gauge panel contains a single [RadialGauges](#) collection. This **RadialGauges** collection contains only one [RadialGauge](#) element. This **RadialGauge** element has its **Name** attribute set to "RadialGauge1".

```
<GaugePanel Name="GaugePanel3">
```

```
<RadialGauges>
  <RadialGauge Name="RadialGauge1">
```

"RadialGauge1" contains only one [RadialScale](#) element within its [RadialGauge.GaugeScales](#) collection. This **RadialScale** element has its **Name** attribute set to "RadialScale1".

```
<GaugeScales>
  <RadialScale Name="RadialScale1">
    <GaugePointers>
```

"RadialScale1" contains only one [RadialPointer](#) element within its [RadialScale.GaugePointers](#) collection. This **RadialPointer** element has its **Name** attribute set to "RadialPointer1". "RadialPointer1" has [RadialPointer.GaugeInputValue](#) set to "Sum(Fields!UnitsOnOrder.Value)", which means that the pointer will point at the value that is equal to the cumulative sum of all values for the "UnitsOnOrder" [Field](#), which evaluates to a value between 500 and 1000.

```
<RadialPointer Name="RadialPointer1">
  <PointerCap>

    <MarkerStyle>Wedge</MarkerStyle>
    <Placement>Inside</Placement>
    <Width>15</Width>
  </RadialPointer>
</GaugePointers>

```

"RadialScale1" contains only one [ScaleRange](#) element within its [ScaleRanges](#) collection. This **ScaleRange** element has its **Name** attribute set to "RadialRange1". "RadialRange1" has ScaleRange's [Style.BackgroundGradientEndColor](#) set to "Salmon" and ScaleRange's [Style.BackgroundGradientType](#) set to "DiagonalLeft". These settings affect the viewing layout of "RadialRange1", as seen in the previous figure. The width of "RadialRange1" varies from 15 percent of the radius of "RadialScale1" at the beginning of the range to 30 percent of the radius of "RadialScale1" at the end of the range. The actual values for "RadialRange1" go from 10 percent to 90 percent of the cumulative sum of all values for the "UnitsInStock" field.

```

<ScaleRanges>
  <ScaleRange Name="RadialRange1">
    <Style>
      <Border>
        <Color>Silver</Color>
        <Style>Solid</Style>

      <BackgroundGradientType>DiagonalLeft</BackgroundGradientType>

      <Multiplier>1</Multiplier>
    </StartValue>
    <EndValue>
      <Value>=0.9*Sum(Fields!UnitsInStock.Value)</Value>
      <Multiplier>1</Multiplier>

    <StartWidth>15</StartWidth>
    <EndWidth>30</EndWidth>

</ScaleRanges>

  <BackgroundHatchType>None</BackgroundHatchType>
  <ShadowOffset>0pt</ShadowOffset>
</Style>
<Interval>NaN</Interval>

```

```
<IntervalOffset>NaN</IntervalOffset>
```

"RadialScale1" has [RadialScale.MinimumValue](#) set to 0 and [RadialScale.MaximumValue](#) set to "=Sum(Fields!UnitsInStock.Value)". This means that the scale that is represented by "RadialScale1" can go from 0 to the cumulative total of all product units that are in stock as recorded by "DataSet1". This cumulative total is slightly greater than 3000.

```
<MaximumValue>
  <Value>=Sum(Fields!UnitsInStock.Value)</Value>
  <Multiplier>1</Multiplier>
</MaximumValue>
<MinimumValue>
  <Value>0</Value>
  <Multiplier>1</Multiplier>
</MinimumValue>
```

The [RadialScale.GaugeMajorTickMarks](#) has [TickMarkStyle.Placement](#) set to "Outside" and no [TickMarkStyle.Shape](#) set. Therefore, the major tick marks, with their intervals defaulted to 500, are placed outside of "RadialScale1" and contain a slim (because [TickMarkStyle.Width](#) is set to only 2) rectangular shape.

```
<GaugeMajorTickMarks>
  <Interval>NaN</Interval>
  <IntervalOffset>NaN</IntervalOffset>
  <Style>

  </TickMarkImage>
  <Length>18</Length>
  <Width>2</Width>
</GaugeMajorTickMarks>
```

The [RadialScale.GaugeMinorTickMarks](#) has [TickMarkStyle.Placement](#) set to "Cross" and no [TickMarkStyle.Shape](#) set. Therefore, the minor tick marks, with their intervals defaulted to 100, are placed directly across "RadialScale1" and contain a slim (because [TickMarkStyle.Width](#) is set to only 1) rectangular shape.

### 3.14 Line Example

The following example demonstrates an RDL [Line](#) element, which is shown in the following figure.

**Figure 21: Line example**

The [Line.Name](#) is set to "Line1". However, [Line.Top](#) is set to 1.25917in and [Line.Left](#) is set to 4in; [Line.Height](#) is set to "-0.95833in" and [Line.Width](#) is set to -2.29167in. This means that "Line1" starts from the lower-right end and goes to the upper-left end. The [Style.Border](#) element, along with its child elements, controls the appearance of "Line1". [Border.Color](#) is set to Green, [Border.Style](#) is set to "Dashed", and [Border.Width](#) is set to 10pt. These settings are reflected in the preceding figure.

```

<Line Name="Line1">
  <Top>1.25917in</Top>
  <Left>4in</Left>

### 3.15 List Example

**Applies to RDL schemas 2003/10 [MS-RDL200310] and 2005/01 [MS-RDL200501] only**

The following example of a [List](#) element is an extract from an RDL specification of a report. This example is from a report for the Adventure Works database. It shows a count of how many distinct products there are and the total quantity of products in inventory at different locations within the company in a list. This example illustrates the use of a **list data region** and how to group details by company location.

The following figure shows the **List** example. An instance of the list consists of the label "Location:" followed by the name of the location, the label "Number of Different Products:" followed by a count of the number of different products at that location, and the label "Total Quantity:" followed by the sum total number of products at that location. These six items appear as [Textbox](#) report items placed in free form within the boundaries of a list instance; that is, they are not aligned in any particular rows and columns. They can be placed anywhere within the list instance boundary. The background colors of two of the **Textbox** report items are set to LemonChiffon and LightGreen.

**Figure 22: Example of a list with grouping**

The following is the extract from the RDL report file that produces the preceding list. The **List** element has its [Name](#) attribute set to "list1". There is a [Sorting](#) element that specifies that this group is sorted by the [Field](#) "Name" in ascending order. As shown in the preceding figure, the locations listed are Debur and Polish, Final Assembly, Finished Goods Storage, and so on, which are sorted in alphabetical (ascending) order. The [Left](#) element specifies that the list is 0.125 inches from

the left edge of the body of the report. The list is bound to the data in the [DataSet](#) "DataSet1" by the [List.DataSetName](#) element.

```
<List Name="list1">
  <Sorting>
    <SortBy>
      <SortExpression>=Fields!Name.Value</SortExpression>
      <Direction>Ascending</Direction>
    </SortBy>
  </Sorting>
  <Left>0.125in</Left>
  <DataSetName>DataSet1</DataSetName>
```

The [ReportItems](#) element specifies the six text boxes that comprise a single instance of list data. The text boxes that have the [Name](#) attribute values "textbox3", "textbox4", and "textbox5" are the labels before the data. The text box that has the **Name** attribute value "Name" is the name of the location in the company, and its [Style.BackgroundColor](#) element is specified as LemonChiffon. The text box that has the **Name** attribute value "textbox2" is the total quantity of products in this location in the company, and its **Style.BackgroundColor** element is specified as LightGreen. Note that its [Value](#) element is an expression that uses the [Sum](#) aggregate function. The text box that has the **Name** attribute value "textbox1" is the count of distinct products in this location in the company. Note that its **Value** element is an expression that uses the [Count](#) aggregate function.

The next elements specify that the **List** is 0.25 inches below the top of its container, which is the report body, and that **List** is 5.25 inches wide. The **Style** element specifies that the entire list is surrounded with a solid border in the default Black color.

The following [Grouping](#) element specifies that the details of the list are grouped by the field named "LocationID". This field is a numerical value that uniquely identifies each location name. Finally, the [Height](#) element specifies that each detail instance of the list is 0.5 inches tall.

```

<Grouping Name="list1_Details_Group">

### 3.16 Rectangle with Image and Textbox Example

The following figure shows an image that was created by using the [Rectangle](#) element and the [Textbox](#) element.

**Figure 23: Rectangle with an image and a text box**

The [Name](#) attribute of the **Rectangle** element is set to "Rectangle1". "Rectangle1" contains two child elements within its [Rectangle.ReportItems](#) collection: an [Image](#) element and a **Textbox** element.

The [Name](#) attribute of the **Image** element within "Rectangle1" is set to "Image2". [Image.Source](#) for "Image2" is set to External, which means that [Image.Value](#) expects an [RdlURL](#) value or an expression that evaluates to the location of an actual image. For "Image2", **Image.Value** is set to <http://www.widgets.microsoft.com/SSRSLogo.jpg>, which stores the image shown above that shows an icon to the left and the words "Microsoft SQL Server Reporting Services" to the right.

```
<Rectangle Name="Rectangle1">
  <ReportItems>
    <Image Name="Image2">
      <Source>External</Source>
      <Value>http://widgets.microsoft.com/SSRSLogo.jpg</Value>
      <Sizing>FitProportional</Sizing>
      <Height>1.26042in</Height>
      <Width>4.25in</Width>
      <Style>
        <Border>
          <Style>None</Style>
        </Border>
        <PaddingLeft>1pt</PaddingLeft>
        <PaddingRight>1pt</PaddingRight>
        <PaddingTop>1pt</PaddingTop>
      </Style>
    </Image>
  </ReportItems>
</Rectangle>
```

```

    <PaddingBottom>1pt</PaddingBottom>
  </Style>
</Image>

```

The [Name](#) attribute of the **Textbox** element within "Rectangle1" is set to "Textbox1". "Textbox1" is a simple text box. It contains only one [Paragraph](#) within its [Textbox.Paragraphs](#) collection. Within that one **Paragraph**, "Textbox1" contains only one [TextRun](#) within the [Paragraph.TextRuns](#) collection. Because [Style.WritingMode](#) is set to Vertical for "Textbox1", the text goes from up to down instead of from left to right.

The only **Paragraph** within "Textbox1" has [Paragraph.LeftIndent](#) set to 5pt and [Paragraph.RightIndent](#) set to 5pt. This causes the text within that **Paragraph** to be offset 5 points both to the left and right. However, because **Style.WritingMode** is set to Vertical, the offsets are instead applied to the top and bottom, respectively. Similarly, setting [Paragraph.HangingIndent](#) to 10pt additionally offsets the first line of text within the **Paragraph** 10 points from the top. Finally, because [Textbox.CanGrow](#) is set to true, both "Textbox1" and "Rectangle1" expand vertically beyond their respective heights of 0.65972 inches and 1.94792 inches.

```

<Textbox Name="Textbox1">
  <CanGrow>true</CanGrow>
  <KeepTogether>true</KeepTogether>
  <Paragraphs>
    <Paragraph>

        <TextRun>

          <Style>
            <WritingMode>Vertical</WritingMode>
          </Style>
        </TextRun>
      </TextRuns>
      <LeftIndent>5pt</LeftIndent>
      <RightIndent>5pt</RightIndent>
      <HangingIndent>10pt</HangingIndent>
    </Paragraph>
  </Paragraphs>
  <rd:DefaultName>Textbox1</rd:DefaultName>
  <Top>1.28819in</Top>
  <Height>0.65972in</Height>
  <Width>4.25in</Width>
  <ZIndex>1</ZIndex>
  <Style>
    <WritingMode>Vertical</WritingMode>
    <Border>
      <Style>None</Style>
    </Border>
    <BackgroundColor>Red</BackgroundColor>
    <PaddingLeft>2pt</PaddingLeft>
    <PaddingRight>2pt</PaddingRight>
    <PaddingTop>2pt</PaddingTop>
    <PaddingBottom>2pt</PaddingBottom>
  </Style>

<Top>0.56125in</Top>
<Left>1.11333in</Left>
<Height>1.94792in</Height>
<Width>4.25in</Width>

```

"Rectangle1" has [Style.BackgroundColor](#) set to Yellow. This also applies to "Image2" because the **Image** that is associated with "Image2" contains a transparent background. However, because "Textbox2" has [Style.BackgroundColor](#) set to Red, the background of "Textbox2" is red instead of yellow, as shown in the preceding figure.

```

<Style>
  <BackgroundColor>Yellow</BackgroundColor>

    <Style>None</Style>

</Style>

### 3.17 Map Example

The following example report is a map that shows the results for the 2008 United States presidential election. The states are colored based on the winning candidate. This map also shows a bubble for each state. The bubble size is based on the number of electoral votes for each state.

**Figure 24: Map example**

The data source that is used in this report is "ElectionMap". Two datasets, "Spatial" and "Analytics", are defined in the report. The map report item contains one [MapPolygonLayer](#) that shows the map of the states.

The [MapSpatialDataSet](#) element within the layer describes how the spatial data is retrieved from the "Spatial" dataset. The [MapSpatialDataSet.DataSetName](#) element specifies the name of the dataset to be bound to. The [MapSpatialDataSet.SpatialField](#) element specifies the name of the field to use as the source for the spatial data. The [MapFieldNames](#) element specifies the name of the non-spatial fields to associate with the spatial elements. (Typically, these fields are used to join the spatial elements to the analytical dataset.)

The [MapDataRegion](#) element named "Map1\_PolygonLayer1\_DataRegion" specifies the source for analytical data. In this case, the source is the "Analytics" dataset. The [MapMember](#) element specifies how the rows in the dataset are grouped. In this case, the data is grouped by state by the group expression =Fields!State.Value.

After the spatial data and the analytical data are defined, the [MapBindingFieldPairs](#) element specifies how these data are joined together. Each [MapBindingFieldPair](#) element specifies a FieldName from the spatial data and a BindingExpression from the analytical data. If all the pairs match, the spatial element is bound to the analytical data.

Next is the role of the rules by which to visualize the analytical data. The polygon layer contains a [MapPolygonRules](#) element that has a [MapColorRangeRule](#). This rule specifies the range of color to use to colorize the shapes, and a [DataValue](#) element to choose which field to visualize (in this case, =Fields!Winner.Value).

To display the bubble for the number of electoral votes, a [MapPolygonLayer.MapCenterPointRules](#) element is defined in the layer together with the [MapSizeRule](#) element. The **MapSizeRule** element controls the size of the bubbles based on the expression =Sum(Fields!ID\_EV.Value).

### 3.18 Matrix Example

**Applies to RDL schemas 2003/10 [MS-RDL200310] and 2005/01 [MS-RDL200501] only**

The following example of a [Matrix](#) element is an extract from an RDL specification of a report. This example is from a report for the AdventureWorks database and shows sales by quarter and product category. This example illustrates the use of a **matrix data region** that provides drilldown from summary data into detail data by showing and hiding rows. The following figures show the matrix in its collapsed state and in a partially expanded state.

The following figure shows the **Matrix** example in its collapsed state. The row headers are the product categories Components, Clothing, Bikes, and Accessories. They are sorted in descending order. The column headers are the years 2002 and 2003; they are sorted in ascending order. The detail cells contain sales data that represent the sum total of all sales for a given category and year. Clicking a plus sign in the category row headers or year column headers expands the row or column to drill down into the data.

	2002	2003
Components	\$3,611,041	\$5,489,741
Clothing	\$489,820	\$1,024,474
Bikes	\$26,664,534	\$35,199,346
Accessories	\$93,797	\$595,014

**Figure 25: Example of a matrix with dynamic columns in collapsed state**

The following figure shows the **Matrix** example in a partially expanded state. In the Bikes category, a row header is expanded to show the three subcategories of Mountain Bikes, Road Bikes, and Touring Bikes. Also, the column header 2003 is expanded to show the four quarters of 2003. The cell data now represents the sum total of all sales per subcategory and quarter for those cells that are in a subcategory row and under a quarter column. In a partially expanded matrix, there are also details cells that present data at a higher summarization level. For example, the value \$262,613 is the sum total of all sales for all subcategories of Accessories for the third quarter of 2003. This is because the row Accessories is not expanded.

		2002	2003			
			Q1	Q2	Q3	Q4
Components		\$3,611,041	\$459,086	\$1,111,521	\$2,527,699	\$1,391,434
Clothing		\$489,820	\$106,041	\$192,633	\$395,458	\$330,343
Bikes	Mountain Bikes	\$10,893,468	\$2,517,500	\$2,908,659	\$3,617,012	\$3,808,656
	Road Bikes	\$15,771,066	\$3,584,255	\$4,119,659	\$3,844,124	\$3,734,892
	Touring Bikes				\$3,298,006	\$3,766,585
Accessories		\$93,797	\$15,628	\$32,845	\$262,613	\$283,928

**Figure 26: Example of a matrix with dynamic columns in partially expanded state**

The following is the extract from the RDL report file that produces the matrix that is shown above. The **Matrix** element has its [Name](#) attribute set to "SalesMatrix". It has a single [MatrixColumn](#) in the

[MatrixColumns](#) collection that specifies the width of the cells of the detail data to be 0.875 inches. The matrix is bound to the data in the [DataSet](#) "Sales" by the [Matrix.DataSetName](#) element.

```
<Matrix Name="SalesMatrix">
  <MatrixColumns>
    <MatrixColumn>
      <Width>0.875in</Width>
    </MatrixColumn>
  </MatrixColumns>
  <DataSetName>Sales</DataSetName>
  <RowGroupings>
```

This matrix has two [RowGrouping](#) elements in its [RowGroupings](#) collection. This is an ordered list specifying the groupings from outermost to innermost. The first **RowGrouping** element specifies a grouping by category. The width of this **RowGrouping** is set to 1.125 inches, which is the width of the expanded row header cell containing "Bikes" in the preceding figure.

The first **RowGrouping** element has a [DynamicRows](#) element that specifies the content of the row header along with grouping and sorting information. The [Textbox](#) with [Name](#) attribute "Category" has a [Style](#) element that specifies that the row header value should be white lettering on a steel blue background. The values that should be displayed as row headers come from the [Field](#) named "ProdCat" as is specified in the [Value](#) element of the **Textbox** as the expression =Fields!ProdCat.Value.

There is a [Grouping](#) element with its [Name](#) attribute set to "ProductCategory" that specifies that the data is grouped by the expression "=Fields!ProdCat.Value"; that is, the data is grouped by the "ProdCat" **Field**. Also, there is a [Sorting](#) element that specifies that this group is sorted by the "ProdCat" **Field** in descending order. This is seen in the preceding figure where the categories listed are Components, Clothing, Bikes, and Accessories, which are sorted in reverse alphabetical (descending) order.

The second **RowGrouping** element specifies a grouping by subcategory. The width of this **RowGrouping** is set to 1.125 inches, which is the width of the row header cell containing Mountain Bikes in the figure. This **RowGrouping** element has a **DynamicRows** element that specifies the content of the row header along with grouping and sorting information. The **Textbox** with **Name** attribute "SubCategory" has a **Style** element that specifies that the row header value should be white lettering on a steel blue background. The values to display as row headers come from the **Field** named "SubCat" as is specified in the **Value** element of the **Textbox** as the expression =Fields!SubCat.Value.

This element has something that the previous **RowGrouping** does not have. It has the [Visibility](#) element, which specifies that this row grouping should initially be hidden and that the **RowGrouping** that has the **Name** attribute "Category" is used to toggle whether this row grouping is visible or hidden—that is, expanded or collapsed.

The **Grouping** element that has the **Name** attribute "ProductSubcategory" specifies that the data is grouped by the expression =Fields!SubCat.Value, that is, grouped by the **Field** "SubCat". Also, a **Sorting** element specifies that this group is sorted by the **Field** "SubCat" in ascending order. This is shown in the figure where the subcategories are Mountain Bikes, Road Bikes, and Touring Bikes, which are sorted in alphabetical (ascending) order.

This matrix has a single [MatrixRow](#) element in its [MatrixRows](#) collection. This **MatrixRow** has a single [MatrixCell](#) element in its [MatrixCells](#) collection. The **Textbox** specifies the content of the details cells of the matrix. It sets the background color to white; the content of the details is an aggregate expression that computes the total sales under the current row headers and column headers of the details cell. That aggregate is specified by the expression =Sum(Fields!Sales.Value).

The height of this **MatrixRow** is set to 0.25 inches, which is the height of a detail cell such as the one containing \$283,928 in the figure.

Additionally, just after the **MatrixRows** element, the **Top** element specifies that the matrix is placed 1.0625 inches below the top of its parent report item.

This matrix has two [ColumnGrouping](#) elements in its [ColumnGroupings](#) collection. This is an ordered list that specifies the groupings from outermost to innermost. The first **ColumnGrouping** element specifies a grouping of sales orders by year. The height of this **ColumnGrouping** is set at the end of this element to 0.25 inches, which is the height of the expanded column header cell containing 2003 in the figure. This element has a [DynamicColumns](#) element that specifies the content of the

column header, along with grouping and sorting information. The **Textbox** that has its **Name** attribute set to "OrderYear" has a **Style** element that specifies that the column header value should be white lettering on a steel blue background. The values to display as column headers come from the **Field** named "OrderYear" as is specified in the **Value** element of the **Textbox** as the expression =Fields!OrderYear.Value.

A **Grouping** element with its **Name** attribute set to "OrderYear" specifies that the data is grouped by the expression =Fields!OrderYear.Value. That is, the data is grouped by the "OrderYear" **Field**. Also, there is a **Sorting** element that specifies that this group is sorted by the "OrderYear" **Field** in ascending order. This is shown in the preceding figure in which the years that are listed are 2002 and 2003, which are sorted in ascending order.

The second **ColumnGrouping** element specifies a grouping of the sales orders by quarter. The height of this **ColumnGrouping** is set at the end of this element to 0.25 inches, which is the height of the column header cell containing "Q1" in the preceding figure. This **ColumnGrouping** element has a **DynamicColumns** element that specifies the content of the column header, along with grouping and sorting information. The **Textbox** that has its **Name** attribute set to "OrderQuarter" has a **Style** element that specifies that the column header value should be white lettering on a steel-blue background. The values to display as column headers come from the **Field** named "OrderQtr"; this is specified in the **Value** element of the **Textbox** as the expression =Fields!OrderQtr.Value.

This element also has a **Visibility** element, which specifies that this column grouping is initially hidden and that the **ColumnGrouping** that has the **Name** attribute "OrderYear" is used to toggle this column grouping between visible or hidden, that is, expanded or collapsed.

The **Grouping** element that has the **Name** attribute "OrderQtr" specifies that the data is grouped by the expression =Fields!OrderQtr.Value; that is, the data is grouped by the **Field** "OrderQtr". Also, there is a **Sorting** element that specifies that this group is sorted by the **Field** "OrderQtr" in ascending order. This matrix has a [Comer](#) element that consists of a **Textbox** that has no value. Since this **Textbox** does not have a border and has no value, the upper-left corner of the matrix is blank. Just preceding this **Corner** element is the [Width](#) element, which specifies that the initial width of the matrix is 3.125 inches. The actual width of the matrix is derived from the sum of the widths of the component row and column headers.

The [Height](#) element specifies that the initial height of the matrix is 0.75 inches. The actual height of the matrix is derived from the sum of the heights of the component row and column headers. ### 3.19 Table Example

Applies to RDL schemas 2003/10 [\[MS-RDL200310\]](#) and 2005/01 [\[MS-RDL200501\]](#) only

The following example of a [Table](#) element is an extract from an RDL specification of a report. This example is from a report for the AdventureWorks database and shows year-to-date (YTD) sales and last year's sales for each salesperson grouped by region and sales territory. This example illustrates the use of a table data region to provide a tabular grouped listing of data in a grid, providing subtotals for each of the two groups and a grand total for the whole table.

The following figure shows the **Table** example. The first and last rows of the table have a dark blue background color. These are the header and footer rows of the table. The header provides column headers and the footer provides grand totals of YTD sales and last year's sales. The rows with the medium blue background color present subtotals of sales for all the territories within a region. The rows with the light blue background color present the subtotals of sales for all the salespersons within a territory. The rows with the white background color are the detail rows of the table, which provide the sales information for each salesperson.

**Figure 27: Example of a table with grouping and totals rows**

The following is the extract from the RDL report file that produces the preceding table. The **Table** element has its **Name** attribute set to "table1". The table is bound to the data in the [DataSet](#) AdventureWorks by the [Table.DataSetName](#) element. The [Top](#) element specifies that the table is 0.33 inches from the top edge of its containing report item, which is the body of the report.

```

<Table Name="table1">
  <DataSetName>AdventureWorks</DataSetName>

This table has two [TableGroup](#) elements in its [TableGroups](#) collection. This is an ordered list that specifies the groupings from outermost to innermost. The first **TableGroup** element specifies a grouping by region.

The [Grouping](#) element that has its **Name** attribute set to "table1\_Region" that specifies that the data is grouped by the expression =Fields!Region.Value; that is, the data is grouped by the [Field](#) "Region". The [Sorting](#) element specifies that this group is sorted by the **Field** "Region" in ascending order. This is shown in the figure where the regions listed are Europe, North America, and Pacific, which are sorted in alphabetical (ascending) order.

```

<TableGroup>

      <Direction>Ascending</Direction>
    </SortBy>
  </Sorting>

```

The [Footer](#) element of the **TableGroup** specifies the rows in the figure that are medium blue in color. These are the lines that represent the total sales for all territories in a region. The [Textbox](#) that has its **Name** attribute value set to "textbox7" specifies the Total label. The text boxes with **Name** attribute values "textbox10" and "textbox11" specify expressions by using the aggregate function [Sum](#) to total all the YTD and last year's sales values in this grouping scope.

The **Footer** element of this **TableGroup** specifies the rows in the figure that are light blue in color. These are the lines that represent the total sales for all salespersons within a sales territory. The **Textbox** with the **Name** attribute value "textbox13" specifies the label "subtotal". The text boxes with **Name** attribute values "textbox15" and "textbox16" specify expressions by using the aggregate function **Sum** to total all the YTD and last year's sales values in this grouping scope.

The [Details](#) element of this **Table** specifies the rows in the figure that have a white background color. These are the rows that represent the details of sales for each salesperson within a sales territory. The text boxes with the **Name** attribute values "Region" and "Sales\_Territory" specify the values of the region and sales territory for a given salesperson. The [Textbox.HideDuplicates](#) element specifies that only the first occurrence of each of these will appear within their respective groups.

This is why the values North America and Canada are not repeated for the details row for salesperson Garrett R Vargas in the figure. The **Textbox** with the **Name** attribute value "Sales\_Person" specifies the name of the salesperson. The remaining two text boxes specify the salesperson's YTD sales and last year's sales.

The following **Sorting** element specifies that the details are sorted by the **Field** "LastName" in ascending order. Note that the **Field** "Sales\_Person" is not used to sort the details because this would sort the salespersons by their full name, which would sort them by their first name.

## 4 Security Considerations

Because Report Definition Language contains only metadata about the report, there are no security considerations for the RDL file itself. Products that implement report processing using RDL as a basis should, however, be aware of the inherent security risks in the execution of the arbitrary Visual Basic.Net expressions, custom code, and external class references contained within the report.

## 6 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products and technologies:

- Microsoft® SQL Server® 2008 R2
- Microsoft® SQL Server® 2008
- Microsoft® SQL Server® 2005
- Microsoft® SQL Server® 2000

Exceptions, if any, are noted below. Unless otherwise specified, any statement of optional behavior in this specification prescribed using the terms SHOULD or SHOULD NOT implies the aforementioned Microsoft products' behavior is in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that these Microsoft products do not follow the prescription.

<1> [Section 2.2.7](#): The file format validation implementation in both SQL Server 2000 and SQL Server 2005 Reporting Services restricts sizes to a maximum of 160 inches or the equivalent. SQL Server 2008 Reporting Services restricts sizes to a maximum of 455 inches or the equivalent.

<2> [Section 2.3.5](#): In the Microsoft implementation, the code MUST be specified in a Visual Basic-compatible syntax [\[MS-VBNET\]](#).

<3> [Section 2.6.1](#): The value of the [Body.Columns](#) element MUST be less than or equal to 1000.

<4> [Section 2.7.1](#): The value of the **Page.Columns** element MUST be less than or equal to 1000.

<5> [Section 2.17.3](#): The value of the **Paragraph.ListLevel** element MUST be less than or equal to 9.

<6> [Section 2.29.2](#): The uniqueness and content of the **TablixCell.DataElementName** is not required for the RDL format but is a Microsoft implementation that is enforced during data rendering to ensure a useable data extract.

<7> [Section 2.88.2](#): The value of the **ChartAxisScaleBreak.CollapsibleSpaceThreshold** element MUST be greater than or equal to 10 and less than or equal to 90.

<8> [Section 2.88.5](#): The value of the **ChartAxisScaleBreak.MaxNumberOfBreaks** element MUST be less than or equal to 5.
